Register: AIN141_EF_READ_D (AIN#(0:149)_EF_READ_D@141)

Address: 8182

```
property ain142_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN165_BINARY (AIN#(0:254)_BINARY@165)

Address: 50330

```
property ain166_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN166_BINARY (AIN#(0:254)_BINARY@166)

Address: 50332

```
property ain167_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN167_BINARY (AIN#(0:254)_BINARY@167)

Address: 50334

```
property ain168_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN168_BINARY (AIN#(0:254)_BINARY@168)

Address: 50336

```
property ain169_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN169_BINARY (AIN#(0:254)_BINARY@169)

Address: 50338

```
property ain16_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

property ain196_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN196_BINARY (AIN#(0:254)_BINARY@196)

Address: 50392

```
property ain197_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN197_BINARY (AIN#(0:254)_BINARY@197)

Address: 50394

```
property ain198_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN198_BINARY (AIN#(0:254)_BINARY@198)

Address: 50396

```
property ain199_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN199_BINARY (AIN#(0:254)_BINARY@199)

Address: 50398

```
property ain19_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Address: 7306

```
property ain3_ef_read_c: float
```

Function dependent on selected feature index.

Register: AIN3_EF_READ_C (AIN#(0:149)_EF_READ_C@3)

Address: 7606

```
property ain3_ef_read_d: float
```

Function dependent on selected feature index.

Register: AIN3_EF_READ_D (AIN#(0:149)_EF_READ_D@3)

Address: 7906

```
property ain3_negative_ch: int
```

Specifies the negative channel to be used for each positive channel. 199=Default=> Single-Ended.

Register: AIN3_NEGATIVE_CH (AIN#(0:3)_NEGATIVE_CH@3)

Address: 41003

```
property ain3_range: float
```

The range/span of each analog input. Write the highest expected input voltage.

Register: AIN3_RANGE (AIN#(0:3)_RANGE@3)

Address: 40006

```
property ain3_resolution_index: int
```

The resolution index for command-response and AIN-EF readings. A larger resolution index generally results in lower noise and longer sample times.

Register: AIN3_RESOLUTION_INDEX (AIN#(0:3)_RESOLUTION_INDEX@3)

Address: 41503

```
property ain3_settling_us: float
```

Settling time for command-response and AIN-EF readings.

Register: AIN3_SETTLING_US (AIN#(0:3)_SETTLING_US@3)

Address: 42006

```
property ain4: float
```

Returns the voltage of the specified analog input.

Register: AIN4 (AIN#(0:11)@4)

Address: 8

```
property ain40_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

property ain67_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Address: 8042

```
property ain72_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN99_EF_READ_D (AIN#(0:149)_EF_READ_D@99)

Address: 8098

```
property ain9_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN9_BINARY (AIN#(0:254)_BINARY@9)

Address: 50018

Function dependent on selected feature index.

Register: AIN9_EF_READ_D (AIN#(0:149)_EF_READ_D@9)

Address: 7918

```
property ain_all_ef_index: int
```

Write 0 to deactivate AIN_EF on all AINs. No other values may be written to this register. Reads will return the AIN_EF index if all 128 AINs are set to the same value. If values are not the same returns 0xFFFF (65535).

Register: AIN_ALL_EF_INDEX

Address: 43906

```
property ain_all_negative_ch: int
```

A write to this global parameter affects all AIN. Writing 1 will set all AINs to differential. Writing 199 will set all AINs to single-ended. A read will return 1 if all AINs are set to differential and 199 if all AINs are set to single-ended. If AIN configurations are not consistent 0xFFFF will be returned.

Register: AIN_ALL_NEGATIVE_CH

Address: 43902

```
property ain_all_range: float
```

A write to this global parameter affects all AIN. A read will return the correct setting if all channels are set the same, but otherwise will return -9999.

Register: AIN_ALL_RANGE

Address: 43900

```
property ain_all_resolution_index: int
```

The resolution index for command-response and AIN-EF readings. A larger resolution index generally results in lower noise and longer sample times. A write to this global parameter affects all AIN. A read will return the correct setting if all channels are set the same, but otherwise will return 0xFFFF.

Register: AIN_ALL_RESOLUTION_INDEX

Address: 43903

```
property ain_all_settling_us: float
```

Settling time for command-response and AIN-EF readings. A write to this global parameter affects all AIN. A read will return the correct setting if all channels are set the same, but otherwise will return -9999. Max is 50,000 us.

Register: AIN_ALL_SETTLING_US

Address: 43904

```
property asynch_baud: int
```

The symbol rate that will be used for communication. 9600 is typical. Up to 38400 works, but heavily loads the T7's processor.

Register: ASYNCH_BAUD

Address: 5420

```
property asynch_data_rx: int
```

Read received data from here.

This register is a buffer. Underrun behavior - fill with zeros.

Register: ASYNCH_DATA_RX

Address: 5495

```
property asynch_data_tx: int
```

Write data to be transmitted here. This register is a buffer.

Register: ASYNCH_DATA_TX

Address: 5490

```
property asynch_enable: int
```

1 = Turn on Asynch. Configures timing hardware, DIO lines and allocates the receiving buffer.

Register: ASYNCH_ENABLE

Address: 5400

```
property asynch_num_bytes_rx: int
```

The number of data bytes that have been received.

Register: ASYNCH_NUM_BYTES_RX

Address: 5435

```
property asynch_num_bytes_tx: int
```

The number of bytes to be transmitted after writing to GO. Max is 256.

Register: ASYNCH_NUM_BYTES_TX

Address: 5440

```
property asynch_num_data_bits: int
```

The number of data bits per frame. 0-8, 0=8.

Register: ASYNCH_NUM_DATA_BITS

Address: 5415

```
property asynch_num_parity_errors: int
```

The number of parity errors that have been detected. Cleared when UART is enabled. Can also be cleared by writing 0.

Register: ASYNCH_NUM_PARITY_ERRORS

Address: 5465

```
property asynch_num_stop_bits: int
```

The number of stop bits. Values: 0 = zero stop bits, 1 = one stop bit, 2 = two stop bits.

Register: ASYNCH_NUM_STOP_BITS

Address: 5455

```
property asynch_parity: int
```

Parity setting: 0=none, 1=odd, 2=even.

Register: ASYNCH_PARITY

Address: 5460

```
property asynch_rx_buffer_size_bytes: int
```

Number of bytes to use for the receiving buffer. Max is 2048. 0 = 200.

Register: ASYNCH_RX_BUFFER_SIZE_BYTES

Address: 5430

```
property asynch_rx_dionum: int
```

The DIO line that will receive data. (RX)

Register: ASYNCH_RX_DIONUM

Address: 5405

```
property asynch_tx_dionum: int
```

The DIO line that will transmit data. (TX)

Register: ASYNCH_TX_DIONUM

Address: 5410

```
property asynch_tx_go: int
```

Write a 1 to this register to initiate a transmission.

Register: ASYNCH_TX_GO

Address: 5450

```
property bootloader_version: float
```

The bootloader version installed on the main processor.

Register: BOOTLOADER_VERSION

Address: 60006

```
property cio0: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: CIO0 (CIO#(0:3)@0)

Address: 2016

```
property cio1: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: CIO1 (CIO#(0:3)@1)

Address: 2017

```
property cio2: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: CIO2 (CIO#(0:3)@2)

Address: 2018

```
property cio3: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: CIO3 (CIO#(0:3)@3)

Address: 2019

```
property cio_direction: int
```

Read or write the direction of the 4 bits of CIO in a single binary-encoded value. 0=Input and 1=Output. The upper 8-bits of this value are inhibits.

Register: CIO_DIRECTION

Address: 2602

```
property cio_mio_state: int
```

Read or write the state of the 12 bits of CIO-MIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written.

Register: CIO_MIO_STATE

Address: 2582

```
property cio_state: int
```

Read or write the state of the 4 bits of CIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written. The upper 8-bits of this value are inhibits.

Register: CIO_STATE

Address: 2502

```
property cleanse: int
```

Writing 0x5317052E to this register will trigger a system cleanse.

Register: CLEANSE

Address: 49090

```
property core_timer: int
```

Internal 32-bit system timer running at 1/2 core speed, thus normally 80M/2 => 40 MHz.

Register: CORE_TIMER

Address: 61520

```
property dac0: float
```

Pass a voltage for the specified analog output.

Register: DAC0 (DAC#(0:1)@0)

Address: 1000

```
property dac0_binary: int
```

Writes binary values to the DACs. Binary values are 16-bit. If the DAC's resolution is less than 16 then the lower bits are ignored. 0 = lowest output, 65535 = highest output.

Register: DAC0_BINARY (DAC#(0:1)_BINARY@0)

Address: 51000

```
property dac1: float
```

Pass a voltage for the specified analog output.

Register: DAC1 (DAC#(0:1)@1)

Address: 1002

```
property dac1_binary: int
```

Writes binary values to the DACs. Binary values are 16-bit. If the DAC's resolution is less than 16 then the lower bits are ignored. 0 = lowest output, 65535 = highest output.

Register: DAC1_BINARY (DAC#(0:1)_BINARY@1)

Address: 51002

```
property dac1_frequency_out_enable: int
```

0 = off, 1 = output 10 Hz signal on DAC1. The signal will be a square wave with peaks of 0 and 3.3V. Note that writing to DAC1 or enabling a stream out which is targeting DAC1 will disable this feature.

Register: DAC1_FREQUENCY_OUT_ENABLE

Address: 61532

```
property device_name_default: str
```

Reads return the current device name. Writes update the default and current device name. A reboot is necessary to update the name reported by NBNS. Up to 49 characters, cannot contain periods.

Register: DEVICE_NAME_DEFAULT

Address: 60500

```
property device_reset_dbg_reg: int
```

Bitmask register that indicates why a device was last re-set. bit0: Power-on reset, bit1: Brown-out, bit2: Wake from idle, bit3: Wake from sleep, bit4: watchdog timer time-out, bit5: reserved, bit6: Software reset, bit7: external reset (MCLR), bit8: Voltage regulator standby, bit9: Configuration mismatch.

Register: DEVICE_RESET_DBG_REG

Address: 60014

An index to specify the feature you want.

Register: DIO12_EF_INDEX (DIO#(0:22)_EF_INDEX@12)

Address: 44124

```
property dio12_ef_options: int
```

Function dependent on selected feature index.

Register: DIO12_EF_OPTIONS (DIO#(0:22)_EF_OPTIONS@12)

Address: 44224

```
property dio12_ef_read_a: int
```

Reads an unsigned integer value. The meaning of the integer is dependent on selected feature index.

Register: DIO12_EF_READ_A (DIO#(0:22)_EF_READ_A@12)

Address: 3024

```
property dio12_ef_read_a_and_reset: int
```

22)_EF_READ_A and forces a reset.

Register: DIO12_EF_READ_A_AND_RESET (DIO#(0:22)_EF_READ_A_AND_RESET@12)

Address: 3124

Type:
Reads the same value as DIO#(0

```
property dio12_ef_read_a_f: float
```

Reads a floating point value. The meaning of value is dependent on selected feature index.

Register: DIO12_EF_READ_A_F (DIO#(0:22)_EF_READ_A_F@12)

Address: 3524

```
property dio12_ef_read_a_f_and_reset: float
```

Reads a floating point value and forces a reset. The meaning of value is dependent on selected feature index.

Register: DIO12_EF_READ_A_F_AND_RESET (DIO#(0:22)_EF_READ_A_F_AND_RESET@12)

Address: 3624

```
property dio12_ef_read_b: int
```

Reads an unsigned integer value. The meaning of the integer is dependent on selected feature index.

Register: DIO12_EF_READ_B (DIO#(0:22)_EF_READ_B@12)

Address: 3224

```
property dio12_ef_read_b_f: float
```

Reads a floating point value. The meaning of value is dependent on selected feature index.

Register: DIO12_EF_READ_B_F (DIO#(0:22)_EF_READ_B_F@12)

Address: 3724

```
property dio13_ef_config_a: int
```

Function dependent on selected feature index.

Register: DIO13_EF_CONFIG_A (DIO#(0:22)_EF_CONFIG_A@13)

Address: 44326

```
property dio13_ef_config_b: int
```

Function dependent on selected feature index.

Register: DIO13_EF_CONFIG_B (DIO#(0:22)_EF_CONFIG_B@13)

Address: 44426

```
property dio13_ef_config_c: int
```

Function dependent on selected feature index.

Register: DIO13_EF_CONFIG_C (DIO#(0:22)_EF_CONFIG_C@13)

Address: 44526

```
property dio13_ef_config_d: int
```

Function dependent on selected feature index.

Register: DIO13_EF_CONFIG_D (DIO#(0:22)_EF_CONFIG_D@13)

Address: 44626

```
property dio13_ef_enable: int
```

1 = enabled. 0 = disabled. Must be disabled during configuration. Note that DIO-EF reads work when disabled and do not return an error.

Register: DIO13_EF_ENABLE (DIO#(0:22)_EF_ENABLE@13)

Address: 44026

```
property dio13_ef_index: int
```

An index to specify the feature you want.

Register: DIO13_EF_INDEX (DIO#(0:22)_EF_INDEX@13)

Address: 44126

```
property dio13_ef_options: int
```

Function dependent on selected feature index.

Register: DIO13_EF_OPTIONS (DIO#(0:22)_EF_OPTIONS@13)

Address: 44226

```
property dio13_ef_read_a: int
```

Reads an unsigned integer value. The meaning of the integer is dependent on selected feature index.

Register: DIO13_EF_READ_A (DIO#(0:22)_EF_READ_A@13)

Address: 3026

```
property dio13_ef_read_a_and_reset: int
```

22)_EF_READ_A and forces a reset.

Register: DIO13_EF_READ_A_AND_RESET (DIO#(0:22)_EF_READ_A_AND_RESET@13)

Address: 3126

Type:
Reads the same value as DIO#(0

```
property dio13_ef_read_a_f: float
```

Reads a floating point value. The meaning of value is dependent on selected feature index.

Register: DIO13_EF_READ_A_F (DIO#(0:22)_EF_READ_A_F@13)

Address: 3526

```
property dio13_ef_read_a_f_and_reset: float
```

Reads a floating point value and forces a reset. The meaning of value is dependent on selected feature index.

Register: DIO13_EF_READ_A_F_AND_RESET (DIO#(0:22)_EF_READ_A_F_AND_RESET@13)

Address: 3626

```
property dio13_ef_read_b: int
```

Reads an unsigned integer value. The meaning of the integer is dependent on selected feature index.

Register: DIO13_EF_READ_B (DIO#(0:22)_EF_READ_B@13)

Address: 3226

```
property dio13_ef_read_b_f: float
```

Reads a floating point value. The meaning of value is dependent on selected feature index.

Register: DIO13_EF_READ_B_F (DIO#(0:22)_EF_READ_B_F@13)

Address: 3726

```
property dio14_ef_config_a: int
```

Function dependent on selected feature index.

Register: DIO14_EF_CONFIG_A (DIO#(0:22)_EF_CONFIG_A@14)

Address: 44328

```
property dio14_ef_config_b: int
```

Function dependent on selected feature index.

Register: DIO14_EF_CONFIG_B (DIO#(0:22)_EF_CONFIG_B@14)

Address: 44428

```
property dio14_ef_config_c: int
```

Function dependent on selected feature index.

Register: DIO14_EF_CONFIG_C (DIO#(0:22)_EF_CONFIG_C@14)

Address: 44528

```
property dio14_ef_config_d: int
```

Function dependent on selected feature index.

Register: DIO14_EF_CONFIG_D (DIO#(0:22)_EF_CONFIG_D@14)

Address: 44628

```
property dio14_ef_enable: int
```

1 = enabled. 0 = disabled. Must be disabled during configuration. Note that DIO-EF reads work when disabled and do not return an error.

Register: DIO14_EF_ENABLE (DIO#(0:22)_EF_ENABLE@14)

Address: 44028

```
property dio14_ef_index: int
```

An index to specify the feature you want.

Register: DIO14_EF_INDEX (DIO#(0:22)_EF_INDEX@14)

Address: 44128

```
property dio14_ef_options: int
```

Function dependent on selected feature index.

Register: DIO14_EF_OPTIONS (DIO#(0:22)_EF_OPTIONS@14)

Address: 44228

```
property dio14_ef_read_a: int
```

Reads an unsigned integer value. The meaning of the integer is dependent on selected feature index.

Register: DIO14_EF_READ_A (DIO#(0:22)_EF_READ_A@14)

Address: 3028

```
property dio14_ef_read_a_and_reset: int
```

22)_EF_READ_A and forces a reset.

Register: DIO14_EF_READ_A_AND_RESET (DIO#(0:22)_EF_READ_A_AND_RESET@14)

Address: 3128

Type:
Reads the same value as DIO#(0

```
property dio14_ef_read_a_f: float
```

Reads a floating point value. The meaning of value is dependent on selected feature index.

Register: DIO14_EF_READ_A_F (DIO#(0:22)_EF_READ_A_F@14)

Address: 3528

```
property dio14_ef_read_a_f_and_reset: float
```

Reads a floating point value and forces a reset. The meaning of value is dependent on selected feature index.

Register: DIO14_EF_READ_A_F_AND_RESET (DIO#(0:22)_EF_READ_A_F_AND_RESET@14)

Address: 3628

```
property dio14_ef_read_b: int
```

Reads an unsigned integer value. The meaning of the integer is dependent on selected feature index.

Register: DIO14_EF_READ_B (DIO#(0:22)_EF_READ_B@14)

Address: 3228

```
property dio14_ef_read_b_f: float
```

Reads a floating point value. The meaning of value is dependent on selected feature index.

Register: DIO14_EF_READ_B_F (DIO#(0:22)_EF_READ_B_F@14)

Address: 3728

Reads a floating point value. The meaning of value is dependent on selected feature index.

Register: DIO9_EF_READ_B_F (DIO#(0:22)_EF_READ_B_F@9)

Address: 3718

```
property dio_analog_enable: int
```

Read or write the analog configuration of all digital I/O in a single binary-encoded value. 1=Analog mode and 0=Digital mode. When switching from analog to digital, the lines will be set to input. Writes are filtered by the value in DIO_INHIBIT.

Register: DIO_ANALOG_ENABLE

Address: 2880

```
property dio_direction: int
```

Read or write the direction of all digital I/O in a single binary-encoded value. 0=Input and 1=Output. Writes are filtered by the value in DIO_INHIBIT.

Register: DIO_DIRECTION

Address: 2850

```
property dio_ef_clock0_count: int
```

Current tick count of this clock. Will read between 0 and ROLL_VALUE-1.

Register: DIO_EF_CLOCK0_COUNT

Address: 44908

```
property dio_ef_clock0_divisor: int
```

Divides the core clock. Valid options: 1,2,4,8,16,32,64,256.

Register: DIO_EF_CLOCK0_DIVISOR

Address: 44901

```
property dio_ef_clock0_enable: int
```

1 = enabled. 0 = disabled. Must be disabled during configuration.

Register: DIO_EF_CLOCK0_ENABLE

Address: 44900

```
property dio_ef_clock0_options: int
```

Bitmask: bit0: 1 = use external clock. All other bits reserved.

Register: DIO_EF_CLOCK0_OPTIONS

Address: 44902

```
property dio_ef_clock0_roll_value: int
```

The clock will count to this value and then start over at zero. The clock pulses counted are those after the divisor. 0 results in the max roll value possible. This is a 32-bit value (0-4294967295) if using a 32-bit clock, and a 16-bit value (0-65535) if using a 16-bit clock.

Register: DIO_EF_CLOCK0_ROLL_VALUE

Address: 44904

```
property dio_ef_clock1_count: int
```

Current tick count of this clock. Will read between 0 and ROLL_VALUE-1.

Register: DIO_EF_CLOCK1_COUNT

Address: 44918

```
property dio_ef_clock1_divisor: int
```

Divides the core clock. Valid options: 1,2,4,8,16,32,64,256.

Register: DIO_EF_CLOCK1_DIVISOR

Address: 44911

```

Bitmask: bit0: 1 = use external clock. All other bits reserved.

Register: DIO_EF_CLOCK2_OPTIONS

Address: 44922

```
property dio_ef_clock2_roll_value: int
```

The clock will count to this value and then start over at zero. The clock pulses counted are those after the divisor. 0 results in the max roll value possible. This is a 32-bit value (0-4294967295) if using a 32-bit clock, and a 16-bit value (0-65535) if using a 16-bit clock.

Register: DIO_EF_CLOCK2_ROLL_VALUE

Address: 44924

```
property dio_inhibit: int
```

A single binary-encoded value where each bit determines whether _STATE, _DIRECTION or _ANALOG_ENABLE writes affect that bit of digital I/O. 0=Default=Affected, 1=Ignored.

Register: DIO_INHIBIT

Address: 2900

```
property dio_pullup_disable: int
```

This register will prevent pullups from being enabled on lines set to digital input. This is a binary coded value where bit 0 represent FIO0 and bit 11 represents EIO3. 1 = pullup disabled, 0 = pullup enabled. This register is not affected by the inhibit register.

Register: DIO_PULLUP_DISABLE

Address: 2890

```
property dio_state: int
```

Read or write the state of all digital I/O in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. A read of an output returns the current logic level on the terminal, not necessarily the output state written. Writes are filtered by the value in DIO_INHIBIT.

Register: DIO_STATE

Address: 2800

```
property eio0: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO0 (EIO#(0:7)@0)

Address: 2008

```
property eio1: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO1 (EIO#(0:7)@1)

Address: 2009

```
property eio2: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO2 (EIO#(0:7)@2)

Address: 2010

```
property eio3: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO3 (EIO#(0:7)@3)

Address: 2011

```
property eio4: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO4 (EIO#(0:7)@4)

Address: 2012

```
property eio5: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO5 (EIO#(0:7)@5)

Address: 2013

```
property eio6: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO6 (EIO#(0:7)@6)

Address: 2014

```
property eio7: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO7 (EIO#(0:7)@7)

Address: 2015

```
property eio_cio_state: int
```

Read or write the state of the 12 bits of EIO-CIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written. As of firmware 1.0172, MIO states are included in the upper nibble of the CIO byte.

Register: EIO_CIO_STATE

Address: 2581

```
property eio_direction: int
```

Read or write the direction of the 8 bits of EIO in a single binary-encoded value. 0=Input and 1=Output. The upper 8-bits of this value are inhibits.

Register: EIO_DIRECTION

Address: 2601

```
property eio_state: int
```

Read or write the state of the 8 bits of EIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written. The upper 8-bits of this value are inhibits.

Register: EIO_STATE

Address: 2501

```
property ethernet_altdns: str
```

Read the current Alt DNS of wired Ethernet.

Register: ETHERNET_ALTDNS

Address: 49108

```
property ethernet_altdns_default: str
```

The Alt DNS of wired Ethernet after a power-cycle to the device.

Register: ETHERNET_ALTDNS_DEFAULT

Address: 49158

```
property ethernet_apply_settings: int
```

Writing 1 to this register power-cycles Ethernet. It tells the device to waits 1s before turning off Ethernet and then 500ms before turning it back on.

Register: ETHERNET_APPLY_SETTINGS

Address: 49190

```
property ethernet_dhcp_enable: int
```

Read the current Enabled/Disabled state of Ethernet DHCP.

Register: ETHERNET_DHCP_ENABLE

Address: 49110

```
property ethernet_dhcp_enable_default: int
```

The Enabled/Disabled state of Ethernet DHCP after a power-cycle to the device.

Register: ETHERNET_DHCP_ENABLE_DEFAULT

Address: 49160

```
property ethernet_dns: str
```

Read the current DNS of wired Ethernet.

Register: ETHERNET_DNS

Address: 49106

```
property ethernet_dns_default: str
```

The DNS of wired Ethernet after a power-cycle to the device.

Register: ETHERNET_DNS_DEFAULT

Address: 49156

```
property ethernet_gateway: str
```

Read the current gateway of wired Ethernet.

Register: ETHERNET_GATEWAY

Address: 49104

```
property ethernet_gateway_default: str
```

The gateway of wired Ethernet after a power-cycle to the device.

Register: ETHERNET_GATEWAY_DEFAULT

Address: 49154

```
property ethernet_ip: str
```

Read the current IP address of wired Ethernet.

Register: ETHERNET_IP

Address: 49100

```
property ethernet_ip_default: str
```

The IP address of wired Ethernet after a power-cycle to the device.

Register: ETHERNET_IP_DEFAULT

Address: 49150

```
property ethernet_mac: str
```

The MAC address of the wired Ethernet module.

Register: ETHERNET_MAC

Address: 60020

```
property ethernet_subnet: str
```

Read the current subnet of wired Ethernet.

Register: ETHERNET_SUBNET

Address: 49102

```
property ethernet_subnet_default: str
```

The subnet of wired Ethernet after a power-cycle to the device.

Register: ETHERNET_SUBNET_DEFAULT

Address: 49152

```
property fio0: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO0 (FIO#(0:7)@0)

Address: 2000

```
property fio1: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO1 (FIO#(0:7)@1)

Address: 2001

```
property fio2: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO2 (FIO#(0:7)@2)

Address: 2002

```
property fio3: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO3 (FIO#(0:7)@3)

Address: 2003

```
property fio4: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO4 (FIO#(0:7)@4)

Address: 2004

```
property fio5: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO5 (FIO#(0:7)@5)

Address: 2005

```
property fio6: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO6 (FIO#(0:7)@6)

Address: 2006

```
property fio7: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO7 (FIO#(0:7)@7)

Address: 2007

```
property fio_direction: int
```

Read or write the direction of the 8 bits of FIO in a single binary-encoded value. 0=Input and 1=Output. The upper 8-bits of this value are inhibits.

Register: FIO_DIRECTION

Address: 2600

```
property fio_eio_state: int
```

Read or write the state of the 16 bits of FIO-EIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written.

Register: FIO_EIO_STATE

Address: 2580

```
property fio_state: int
```

Read or write the state of the 8 bits of FIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written. The upper 8-bits of this value are inhibits.

Register: FIO_STATE

Address: 2500

```
property firmware_version: float
```

The current firmware version installed on the main processor.

Register: FIRMWARE_VERSION

Address: 60004

```
property hardware_installed: int
```

Bitmask indicating installed hardware options. bit0: High Resolution ADC, bit1: WiFi, bit2: RTC, bit3: microSD.

Register: HARDWARE_INSTALLED

Address: 60010

```
property hardware_version: float
```

The hardware version of the device.

Register: HARDWARE_VERSION

Address: 60002

```
property i2c_acks: int
```

A binary encoded value (array of bits) used to observe ACKs from the slave device.

Register: I2C_ACKS

Address: 5114

```
property i2c_data_rx: int
```

Data that has been read from the I2C bus.

This register is a buffer. Underrun behavior - fill with zeros.

Register: I2C_DATA_RX

Address: 5160

```
property i2c_data_tx: int
```

Data that will be written to the I2C bus. This register is a buffer.

Register: I2C_DATA_TX

Address: 5120

```
property i2c_go: int
```

Writing to this register will instruct the LabJack to perform an I2C transaction.

Register: I2C_GO

Address: 5110

```
property i2c_num_bytes_rx: int
```

The number of data bytes to read. Zero is valid and will result in a write-only I2C operation.

Register: I2C_NUM_BYTES_RX

Address: 5109

```
property i2c_num_bytes_tx: int
```

The number of data bytes to transmit. Zero is valid and will result in a read-only I2C operation.

Register: I2C_NUM_BYTES_TX

Address: 5108

```
property i2c_options: int
```

Advanced. Controls details of the I2C protocol to improve device compatibility. bit 0: 1 = Reset the I2C bus before attempting communication. bit 1: 0 = Restarts will use a stop and a start, 1 = Restarts will not use a stop. bit 2: 1 = disable clock stretching.

Register: I2C_OPTIONS

Address: 5103

```
property i2c_scl_dionum: int
```

The number of the DIO line to be used as the I2C clock line. Ex: Writing 1 will force FIO1 to become the I2C-SCL line.

Register: I2C_SCL_DIONUM

Address: 5101

```
property i2c_sda_dionum: int
```

The number of the DIO line to be used as the I2C data line. Ex: Writing 0 will force FIO0 to become the I2C-SDA line.

Register: I2C_SDA_DIONUM

Address: 5100

```
property i2c_slave_address: int
```

The 7-bit address of the slave device. Value is shifted left by firmware to allow room for the I2C R/W bit.

Register: I2C_SLAVE_ADDRESS

Address: 5104

```
property i2c_speed_throttle: int
```

This value controls the I2C clock frequency. Pass 0-65535. Default=0 corresponds to 65536 internally which results in ~450 kHz. 1 results in ~40 Hz, 65516 is ~100 kHz.

Register: I2C_SPEED_THROTTLE

Address: 5102

```
property internal_flash_calculate_crc: int
```

Calculates the checksum of a 4096 byte flash page.

Register: INTERNAL_FLASH_CALCULATE_CRC

Address: 61842

```
property internal_flash_erase: int
```

Erases a 4k section of internal flash starting at the specified address. This register is a buffer.

Register: INTERNAL_FLASH_ERASE

Address: 61820

```
property internal_flash_key: int
```

Sets the region of internal flash to which access is allowed.

Register: INTERNAL_FLASH_KEY

Address: 61800

```
property internal_flash_read: int
```

Data read from internal flash. Read size must be an even number of registers.

Register: INTERNAL_FLASH_READ

Address: 61812

```
property internal_flash_read_pointer: int
```

The address in internal flash that reads will start from.

Register: INTERNAL_FLASH_READ_POINTER

Address: 61810

```
property internal_flash_write: int
```

Data written here will be written to internal flash. Write size must be an even number of registers. This register is a buffer.

Register: INTERNAL_FLASH_WRITE

Address: 61832

```
property internal_flash_write_pointer: int
```

Address in internal flash where writes will begin.

Register: INTERNAL_FLASH_WRITE_POINTER

Address: 61830

```
property io_config_check_for_default: int
```

Returns 1 if the current configuration matches the default configuration.

Register: IO_CONFIG_CHECK_FOR_DEFAULT

Address: 49018

```
property io_config_check_for_factory: int
```

Returns 1 if default settings are the same as factory settings.

Register: IO_CONFIG_CHECK_FOR_FACTORY

Address: 49000

```
property io_config_current_crc32: int
```

Collects the current IO configuration and calculates of a CRC32.

Register: IO_CONFIG_CURRENT_CRC32

Address: 49020

```
property io_config_current_pread: int
```

The address in the current configuration data which reads will start from.

Register: IO_CONFIG_CURRENT_pREAD

Address: 49014

```
property io_config_current_read: int
```

Data read from the current configuration.

Register: IO_CONFIG_CURRENT_READ

Address: 49016

```
property io_config_default_pread: int
```

The address in the configuration data which reads will start from.

Register: IO_CONFIG_DEFAULT_pREAD

Address: 49010

```
property io_config_default_read: int
```

Data read from the startup configuration.

Register: IO_CONFIG_DEFAULT_READ

Address: 49012

```
property io_config_factory_pread: int
```

The address in the factory configuration data which reads will start from.

Register: IO_CONFIG_FACTORY_pREAD

Address: 49006

```
property io_config_factory_read: int
```

Data read from factory configuration.

Register: IO_CONFIG_FACTORY_READ

Address: 49008

```
property io_config_set_current_to_default: int
```

Write a 1 to set current values to default configuration. The default values are retrieved from flash and written to the current configuration registers, thus this behaves similar to reboot/power-up. Systems affected: AIN, DIO, DAC, AIN_EF, DIO_EF.

Register: IO_CONFIG_SET_CURRENT_TO_DEFAULT

Address: 61991

```
property io_config_set_current_to_factory: int
```

Write a 1 to set current values to factory configuration. The factory values are retrieved from flash and written to the current configuration registers. Systems affected: AIN, DIO, DAC, AIN_EF, DIO_EF.

Register: IO_CONFIG_SET_CURRENT_TO_FACTORY

Address: 61990

```
property io_config_set_default_to_current: int
```

Write a 1 to cause new default (reboot/power-up) values to be saved to flash. Current values are retrieved and saved as the new defaults. Systems affected: AIN, DIO, DAC, AIN_EF, DIO_EF.

Register: IO_CONFIG_SET_DEFAULT_TO_CURRENT

Address: 49002

```
property io_config_set_default_to_factory: int
```

Write a 1 to cause new default (reboot/power-up) values to be saved to flash. Factory values are retrieved and saved as the new defaults. Systems affected: AIN, DIO, DAC, AIN_EF, DIO_EF.

Register: IO_CONFIG_SET_DEFAULT_TO_FACTORY

Address: 49004

```
property last_err_detail: int
```

Returns the last LabJack error code seen on the device.

Register: LAST_ERR_DETAIL

Address: 55000

```
property last_err_frame: int
```

Returns the frame number that caused the last error.

Register: LAST_ERR_FRAME

Address: 55002

```
property last_err_transaction_id: int
```

Returns the transaction ID of the Modbus TCP packet that caused the last error.

Register: LAST_ERR_TRANSACTION_ID

Address: 55003

```
property last_mb_err: int
```

Returns the last Modbus TCP error code seen on the device.

Register: LAST_MB_ERR

Address: 55001

```
property led_comm: int
```

Sets the state of the COMM LED when the LEDs are set to manual, see the POWER_LED register.

Register: LED_COMM

Address: 2990

```
property led_status: int
```

Sets the state of the STATUS LED when the LEDs are set to manual, see the POWER_LED register.

Register: LED_STATUS

Address: 2991

```
property lua_debug_data: int
```

Read debug data from here. This register is a buffer.

Register: LUA_DEBUG_DATA

Address: 6024

```
property lua_debug_enable: int
```

Write 1 to this register to enable debugging.

Register: LUA_DEBUG_ENABLE

Address: 6020

```
property lua_debug_enable_default: int
```

This is the value that will be loaded into LUA_DEBUG_ENABLE when the LabJack boots up.

Register: LUA_DEBUG_ENABLE_DEFAULT

Address: 6120

```
property lua_debug_num_bytes: int
```

The number of data bytes in the debug buffer waiting to be read.

Register: LUA_DEBUG_NUM_BYTES

Address: 6022

```
property lua_debug_num_bytes_default: int
```

This is the number of bytes that will be used for the lua debug buffer.

Register: LUA_DEBUG_NUM_BYTES_DEFAULT

Address: 6122

```
property lua_load_saved: int
```

Writing any value reads the script from Flash and loads it into RAM. The script can now be compiled and run.

Register: LUA_LOAD_SAVED

Address: 6034

```
property lua_no_warn_truncation: int
```

Writing a 1 to this register will prevent truncation warnings from being displayed. This register will be cleared every time Lua is started.

Register: LUA_NO_WARN_TRUNCATION

Address: 6050

```
property lua_run: int
```

Writing 1 compiles and runs the Lua script that is loaded in RAM. Writing zero stops the script and begins cleaning up memory. Users may poll the register after writing a value of 0 to verify that the VM is unloaded, and garbage collection is complete. 0 = VM fully unloaded. 1 = Running/in-progress.

Register: LUA_RUN

Address: 6000

```
property lua_run_default: int
```

If set to 1 the script saved in flash will be loaded and run when the LabJack boots up.

Register: LUA_RUN_DEFAULT

Address: 6100

```
property lua_save_to_flash: int
```

Write 1 to save the loaded source code to flash.

Register: LUA_SAVE_TO_FLASH

Address: 6032

```
property lua_saved_read: int
```

Read script saved to flash from here.

Register: LUA_SAVED_READ

Address: 6038

```
property lua_saved_read_pointer: int
```

Address within the saved Lua script in Flash to begin reading from.

Register: LUA_SAVED_READ_POINTER

Address: 6036

```
property lua_source_size: int
```

Allocates RAM for the source code.

Register: LUA_SOURCE_SIZE

Address: 6012

```
property lua_source_write: int
```

Write the source code here. Source will be saved to the RAM allocated by LUA_SOURCE_SIZE. This register is a buffer.

Register: LUA_SOURCE_WRITE

Address: 6014

```
property mio_direction: int
```

Read or write the direction of the 3 bits of MIO in a single binary-encoded value. 0=Input and 1=Output. The upper 8-bits of this value are inhibits.

Register: MIO_DIRECTION

Address: 2603

```
property mio_state: int
```

Read or write the state of the 3 bits of MIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written. The upper 8-bits of this value are inhibits.

Register: MIO_STATE

Address: 2503

```
property onewire_data_rx: int
```

Data received over the 1-wire bus.

This register is a buffer. Underrun behavior - buffer is static, old data will fill the extra locations, firmware 1.0225 changes this to read zeros.

Register: ONEWIRE_DATA_RX

Address: 5370

```
property onewire_data_tx: int
```

Data to be transmitted over the 1-wire bus. This register is a buffer.

Register: ONEWIRE_DATA_TX

Address: 5340

```
property onewire_dpu_dionum: int
```

The dynamic pullup control DIO number.

Register: ONEWIRE_DPU_DIONUM

Address: 5301

```
property onewire_dq_dionum: int
```

The data-line DIO number.

Register: ONEWIRE_DQ_DIONUM

Address: 5300

```
property onewire_function: int
```

Set the ROM function to use. 0xF0=Search, 0xCC=Skip, 0x55=Match, 0x33=Read.

Register: ONEWIRE_FUNCTION

Address: 5307

```
property onewire_go: int
```

Instructs the device to perform the configured 1-wire transaction.

Register: ONEWIRE_GO

Address: 5310

```
property onewire_num_bytes_rx: int
```

Number of data bytes to be received.

Register: ONEWIRE_NUM_BYTES_RX

Address: 5309

```
property onewire_num_bytes_tx: int
```

Number of data bytes to be sent.

Register: ONEWIRE_NUM_BYTES_TX

Address: 5308

```
property onewire_options: int
```

Controls advanced features. Value is a bitmask. bit 0: reserved, bit 1: reserved, bit 2: 1=DPU Enabled 0=DPU Disabled, bit 3: DPU Polarity 1=Active state is high, 0=Active state is low (Dynamic Pull-Up)

Register: ONEWIRE_OPTIONS

Address: 5302

```
property onewire_path_h: int
```

Upper 32-bits of the path to take during a search.

Register: ONEWIRE_PATH_H

Address: 5324

```
property onewire_path_l: int
```

Lower 32-bits of the path to take during a search.

Register: ONEWIRE_PATH_L

Address: 5326

```
property onewire_rom_branchs_found_h: int
```

Upper 32-bits of the branches detected during a search.

Register: ONEWIRE_ROM_BRANCHS_FOUND_H

Address: 5332

```
property onewire_rom_branchs_found_l: int
```

Lower 32-bits of the branches detected during a search.

Register: ONEWIRE_ROM_BRANCHS_FOUND_L

Address: 5334

```
property onewire_rom_match_h: int
```

Upper 32-bits of the ROM to match.

Register: ONEWIRE_ROM_MATCH_H

Address: 5320

```
property onewire_rom_match_l: int
```

Lower 32-bits of the ROM to match.

Register: ONEWIRE_ROM_MATCH_L

Address: 5322

```
property onewire_search_result_h: int
```

Upper 32-bits of the search result.

Register: ONEWIRE_SEARCH_RESULT_H

Address: 5328

```
property onewire_search_result_l: int
```

Lower 32-bites of the search result.

Register: ONEWIRE_SEARCH_RESULT_L

Address: 5330

```
property power_core: int
```

The core processor speed. 0=80MHz, 1=20MHz, 2=2MHz, 3=250kHz.

Register: POWER_CORE

Address: 48001

```
property power_core_default: int
```

Controls the core processor speed after a power-cycle to the device. 0=80MHz, 1=20MHz, 2=2MHz, 3=250kHz.

Register: POWER_CORE_DEFAULT

Address: 48051

```
property power_ethernet: int
```

The current ON/OFF state of the Ethernet module.

Register: POWER_ETHERNET

Address: 48003

```
property power_ethernet_default: int
```

The ON/OFF state of the Ethernet module after a power-cycle to the device. Provided to optionally reduce power consumption.

Register: POWER_ETHERNET_DEFAULT

Address: 48053

```
property power_led: int
```

Sets the LED operation: 0 = Off. Useful for lower power applications. 1 = normal. 2 = Lower power, LEDs will still blink but will normally be off. 3 = Reserved. 4 = Manual, in this mode the LEDs can be user controlled.

Register: POWER_LED

Address: 48006

```
property power_led_default: int
```

The ON/OFF state of the LEDs after a power-cycle to the device.

Register: POWER_LED_DEFAULT

Address: 48056

```
property power_usb: int
```

The current ON/OFF state of the USB module.

Register: POWER_USB

Address: 48002

```
property power_usb_default: int
```

The current ON/OFF state of the USB module after a power-cycle to the device.

Register: POWER_USB_DEFAULT

Address: 48052

```
property product_id: float
```

The numeric identifier of the device. Such as 7 for a T7 / T7-Pro.

Register: PRODUCT_ID

Address: 60000

```
property rtc_set_time_s: int
```

Write a new timestamp to the RTC in seconds since Jan, 1970, aka Epoch or Unix timestamp.

Register: RTC_SET_TIME_S

Address: 61504

```
property rtc_set_time_sntp: int
```

Write any value to instruct the T7 to update its clock from a SNTP server. Requires that SNTP_UPDATE_INTERVAL is non-zero.

Register: RTC_SET_TIME_SNTP

Address: 61506

```
property rtc_time_calendar: int
```

Read six consecutive addresses of type UINT16, starting with this address. The result will be in year, month, day, hour, minute, second calendar format. i.e. [2014, 10, 21, 18, 55, 35]

Register: RTC_TIME_CALENDAR

Address: 61510

```
property rtc_time_s: int
```

Read the current time in seconds since Jan, 1970, aka Epoch or Unix time. This value is calculated from the 80 MHz crystal, not the RTC 32 kHz crystal. Non-pro devices do not have a real time clock, so the reported time is either seconds since device startup or the time reported by the network time protocol over Ethernet. Pro devices have a real time clock that will be used to initialize this register at startup, the time can then be updated by NTP.

Register: RTC_TIME_S

Address: 61500

```
property sbus0_background_enable: int
```

Currently unsupported.

Register: SBUS0_BACKGROUND_ENABLE (SBUS#(0:22)_BACKGROUND_ENABLE@0)

Address: 30250

```
property sbus0_clock_dionum: int
```

This is the DIO# that the external sensor's clock line is connected to.

Register: SBUS0_CLOCK_DIONUM (SBUS#(0:22)_CLOCK_DIONUM@0)

Address: 30225

```
property sbus0_data_dionum: int
```

This is the DIO# that the external sensor's data line is connected to.

Register: SBUS0_DATA_DIONUM (SBUS#(0:22)_DATA_DIONUM@0)

Address: 30200

```
property sbus0_rh: float
```

Reads humidity in % from an external SBUS sensor (EI-1050/SHT1x/SHT7x). # is the DIO line for the EI-1050 enable. If # is the same as the value specified for data or clock line, there will be no control of an enable line.

Register: SBUS0_RH (SBUS#(0:22)_RH@0)

Address: 30150

```
property sbus0_temp: float
```

Reads temperature in Kelvin from an SBUS sensor (EI-1050/SHT1x/SHT7x). SBUS# is the DIO line for the EI-1050 enable. If SBUS# is the same as the value specified for data or clock line, there will be no control of an enable line.

Register: SBUS0_TEMP (SBUS#(0:22)_TEMP@0)

Address: 30100

```
property sbus10_background_enable: int
```

Currently unsupported.

Register: SBUS10_BACKGROUND_ENABLE (SBUS#(0:22)_BACKGROUND_ENABLE@10)

Address: 30260

```
property sbus10_clock_dionum: int
```

This is the DIO# that the external sensor's clock line is connected to.

Register: SBUS10_CLOCK_DIONUM (SBUS#(0:22)_CLOCK_DIONUM@10)

Address: 30235

```
property sbus10_data_dionum: int
```

This is the DIO# that the external sensor's data line is connected to.

Register: SBUS10_DATA_DIONUM (SBUS#(0:22)_DATA_DIONUM@10)

Address: 30210

```
property sbus10_rh: float
```

Reads humidity in % from an external SBUS sensor (EI-1050/SHT1x/SHT7x). # is the DIO line for the EI-1050 enable. If # is the same as the value specified for data or clock line, there will be no control of an enable line.

Register: SBUS10_RH (SBUS#(0:22)_RH@10)

Address: 30170

```
property sbus10_temp: float
```

Reads temperature in Kelvin from an SBUS sensor (EI-1050/SHT1x/SHT7x). SBUS# is the DIO line for the EI-1050 enable. If SBUS# is the same as the value specified for data or clock line, there will be no control of an enable line.

Reads temperature in Kelvin from an SBUS sensor (EI-1050/SHT1x/SHT7x). SBUS# is the DIO line for the EI-1050 enable. If SBUS# is the same as the value specified for data or clock line, there will be no control of an enable line.

Register: SBUS9_TEMP (SBUS#(0:22)_TEMP@9)

Address: 30118

```
property sbus_all_clock_dionum: int
```

A write to this global parameter sets all SBUS clock line registers to the same value. A read will return the correct setting if all channels are set the same, but otherwise will return 0xFF.

Register: SBUS_ALL_CLOCK_DIONUM

Address: 30276

```
property sbus_all_clock_speed: int
```

Sets the clock speed. The clock is software generated so the resulting frequency is not exact. Valid range is 0-65535. Larger values are faster. 0 is the fastest option and is equivalent to 65536. A value of 0 is ~200 kHz. A value of 65000 is ~9.1 kHz.

Register: SBUS_ALL_CLOCK_SPEED

Address: 30278

```
property sbus_all_data_dionum: int
```

A write to this global parameter sets all SBUS data line registers to the same value. A read will return the correct setting if all channels are set the same, but otherwise will return 0xFF.

Register: SBUS_ALL_DATA_DIONUM

Address: 30275

```
property sbus_all_power_dionum: int
```

Sets the power line. This DIO is set to output-high upon any read of SBUS#_TEMP or SBUS#_RH. Default is FIO6 for the T4 and FIO2 for the T7. An FIO line can power up to 4 sensors while an EIO/CIO/MIO line or DAC line can power up to 20 sensors. Set to 9999 to disable. To use multiple power lines, use a DAC line for power, or otherwise control power yourself, set this to 9999 and then control power using writes to normal registers such as FIO5, EIO0, or DAC0.

Register: SBUS_ALL_POWER_DIONUM

Address: 30277

```
property serial_number: int
```

The serial number of the device.

Register: SERIAL_NUMBER

Address: 60028

```
setup_ain0(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN0.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain1(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN1.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain10(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN10.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain11(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN11.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain2(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN2.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain3(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN3.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain4(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN4.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain5(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN5.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain6(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN6.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain7(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN7.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain8(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN8.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain9(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN9.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain_all(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup all AIN channels.

```
property sntp_update_interval: int
```

Sets the SNTP retry time in seconds. A value of zero will disable SNTP(0=default). Values must be 10 or greater.

Register: SNTP_UPDATE_INTERVAL

Address: 49702

```
property spc_frequency_out_enable_deprecated: int
```

This has been deprecated in favor of DAC1_FREQUENCY_OUT_ENABLE. 0 = off, 1 = output 10 Hz signal on SPC. Note that stream uses SPC for a timing output, so if you use this while streaming you will get a lot more counts.

Register: SPC_FREQUENCY_OUT_ENABLE_DEPRECATED

Address: 61530

```
property spi_clk_dionum: int
```

The DIO line for Clock.

Register: SPI_CLK_DIONUM

Address: 5001

```
property spi_cs_dionum: int
```

The DIO line for Chip-Select.

Register: SPI_CS_DIONUM

Address: 5000

```
property spi_data_rx: int
```

Read data here.

This register is a buffer. Underrun behavior - fill with zeros.

Register: SPI_DATA_RX

Address: 5050

```
property spi_data_tx: int
```

Write data here. This register is a buffer.

Register: SPI_DATA_TX

Address: 5010

```
property spi_go: int
```

Write 1 to begin the configured SPI transaction.

Register: SPI_GO

Address: 5007

```
property spi_miso_dionum: int
```

The DIO line for Master-In-Slave-Out.

Register: SPI_MISO_DIONUM

Address: 5002

```
property spi_mode: int
```

The SPI mode controls the clock idle state and which edge clocks the data. Bit 1 is CPOL and Bit 0 is CPHA, so CPOL/CPHA for different decimal values: 0 = 0/0 = b00, 1 = 0/1 = b01, 2 = 1/0 = b10, 3 = 1/1 = b11. For CPOL and CPHA explanations, see Wikipedia article: https://en.wikipedia.org/wiki/Serial_Peripheral_Interface_Bus.

Register: SPI_MODE

Address: 5004

```
property spi_mosi_dionum: int
```

The DIO line for Master-Out-Slave-In.

Register: SPI_MOSI_DIONUM

Address: 5003

```
property spi_num_bytes: int
```

The number of bytes to transfer. The maximum transfer size is 100 bytes.

Register: SPI_NUM_BYTES

Address: 5009

```
property spi_options: int
```

Bit 0 is Auto-CS-Disable. When bit 0 is 0, CS is enabled. When bit 0 is 1, CS is disabled. Bit 1: 0 = Set DIO directions before starting the SPI operations, 1 = Do not set DIO directions. Bit 2: 0 = Transmit data MSB first, 1 = LSB first. Bits 4-7: This value sets the number of bits that will be transmitted during the last byte of the SPI operation. Default is 8, valid options are 1-8.

Register: SPI_OPTIONS

Address: 5006

```
property spi_speed_throttle: int
```

This value controls the SPI clock frequency. Pass 0-65535. Default=0 corresponds to 65536 internally which results in ~800 kHz. 65500 = ~100 kHz, 65100 = ~10 kHz, 61100 = ~1 kHz, 21000 = ~100 Hz, and 1 = ~67 Hz. Avoid setting too low such that the entire transaction lasts longer than the 250 millisecond timeout of the internal watchdog timer.

Register: SPI_SPEED_THROTTLE

Address: 5005

```
property stream_auto_target: int
```

Controls where data will be sent. Value is a bitmask. bit 0: 1 = Send to Ethernet 702 sockets, bit 1: 1 = Send to USB, bit 4: 1 = Command-Response mode. All other bits are reserved.

Register: STREAM_AUTO_TARGET

Address: 4016

```
property stream_buffer_size_bytes: int
```

Size of the stream data buffer in bytes. A value of 0 equates to the default value. Must be a power of 2. Size in samples is STREAM_BUFFER_SIZE_BYTES/2. Size in scans is (STREAM_BUFFER_SIZE_BYTES/2)/STREAM_NUM_ADDRESSES. Changes while stream is running do not affect the currently running stream.

Register: STREAM_BUFFER_SIZE_BYTES

Address: 4012

```
property stream_data_capture_16: int
```

If a channel produces 32-bits of data the upper 16 will be saved here.

Register: STREAM_DATA_CAPTURE_16

Address: 4899

```
property stream_data_cr: int
```

Address to read stream data from when operating in C-R mode.

Register: STREAM_DATA_CR

Address: 4500

```
property stream_enable: int
```

Write 1 to start stream. Write 0 to stop stream. Reading this register returns 1 when stream is enabled. When using a triggered stream the stream is considered enabled while waiting for the trigger.

Register: STREAM_ENABLE

Address: 4990

```
property stream_num_addresses: int
```

The number of entries in the scanlist.

Register: STREAM_NUM_ADDRESSES

Address: 4004

```
property stream_num_scans: int
```

The number of scans to run before automatically stopping (stream-burst). 0 = run continuously. Limit for STREAM_NUM_SCANS is 2^32-1, but if the host is not reading data as fast as it is acquired you also need to consider STREAM_BUFFER_SIZE_BYTES.

Register: STREAM_NUM_SCANS

Address: 4020

```
property stream_out0: int
```

127) to trigger stream-out updates. When added to the scan list these do count against the max scan rate just like normal input addresses, but they do not return any data in the stream read.

Register: STREAM_OUT0 (STREAM_OUT#(0:3)@0)

Address: 4800

Type:
Include one or more of these registers in STREAM_SCANLIST_ADDRESS#(0

```
property stream_out0_buffer_allocate_num_bytes: int
```

Size of the buffer in bytes as a power of 2. Should be at least twice the size of updates that will be written and no less than 32. The usable buffer size will be equal to the value of this register minus 2 bytes (one 16-bit sample). Before writing data to _BUFFER_###, you must write to _BUFFER_ALLOCATE_NUM_BYTES to allocate RAM for the data. Max is 16384.

Register: STREAM_OUT0_BUFFER_ALLOCATE_NUM_BYTES
(STREAM_OUT#(0:3)_BUFFER_ALLOCATE_NUM_BYTES@0)

Address: 4050

```
property stream_out0_buffer_f32: float
```

Data destination when sending floating point data. Appropriate cal constants are used to convert F32 values to 16-bit binary data, and thus each of these values uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT0_BUFFER_F32 (STREAM_OUT#(0:3)_BUFFER_F32@0)

Address: 4400

```
property stream_out0_buffer_status: int
```

The number of values in the buffer that are not currently being used.

Register: STREAM_OUT0_BUFFER_STATUS (STREAM_OUT#(0:3)_BUFFER_STATUS@0)

Address: 4080

```
property stream_out0_buffer_u16: int
```

Data destination when sending 16-bit integer data. Each value uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT0_BUFFER_U16 (STREAM_OUT#(0:3)_BUFFER_U16@0)

Address: 4420

```
property stream_out0_buffer_u32: int
```

Not used at this time. There are no U32 registers supported in stream-out. This register is a buffer.

Register: STREAM_OUT0_BUFFER_U32 (STREAM_OUT#(0:3)_BUFFER_U32@0)

Address: 4410

```
property stream_out0_enable: int
```

When STREAM_OUT#_ENABLE is enabled, the stream out target is generally updated by one value from the stream out buffer per stream scan. For example, there will generally be one instance of e.g. STREAM_OUT0 in the stream scan list, which will cause one STREAM_OUT0_BUFFER value to be consumed and written to STREAM_OUT0_TARGET for every stream scan. The stream scan list could also contain two instances of STREAM_OUT0, in which case two values from STREAM_OUT0_BUFFER value would be consumed and written for every stream scan.

Register: STREAM_OUT0_ENABLE (STREAM_OUT#(0:3)_ENABLE@0)

Address: 4090

```
property stream_out0_loop_num_values: int
```

The number of values, from the end of the array, that will be repeated after reaching the end of supplied data array.

Register: STREAM_OUT0_LOOP_NUM_VALUES (STREAM_OUT#(0:3)_LOOP_NUM_VALUES@0)

Address: 4060

```
property stream_out0_set_loop: int
```

Controls when new data and loop size are used. 1=Use new data immediately. 2=Wait for synch. New data will not be used until a different stream-out channel is set to Synch. 3=Synch. This stream-out# as well as any stream-outs set to synch will start using new data immediately.

Register: STREAM_OUT0_SET_LOOP (STREAM_OUT#(0:3)_SET_LOOP@0)

Address: 4070

```
property stream_out0_target: int
```

Channel that data will be written to. Before writing data to _BUFFER_###, you must write to _TARGET so the device knows how to interpret and store values.

Register: STREAM_OUT0_TARGET (STREAM_OUT#(0:3)_TARGET@0)

Address: 4040

```
property stream_out1: int
```

127) to trigger stream-out updates. When added to the scan list these do count against the max scan rate just like normal input addresses, but they do not return any data in the stream read.

Register: STREAM_OUT1 (STREAM_OUT#(0:3)@1)

Address: 4801

Type:
Include one or more of these registers in STREAM_SCANLIST_ADDRESS#(0

```
property stream_out1_buffer_allocate_num_bytes: int
```

Size of the buffer in bytes as a power of 2. Should be at least twice the size of updates that will be written and no less than 32. The usable buffer size will be equal to the value of this register minus 2 bytes (one 16-bit sample). Before writing data to _BUFFER_###, you must write to _BUFFER_ALLOCATE_NUM_BYTES to allocate RAM for the data. Max is 16384.

Register: STREAM_OUT1_BUFFER_ALLOCATE_NUM_BYTES
(STREAM_OUT#(0:3)_BUFFER_ALLOCATE_NUM_BYTES@1)

Address: 4052

```
property stream_out1_buffer_f32: float
```

Data destination when sending floating point data. Appropriate cal constants are used to convert F32 values to 16-bit binary data, and thus each of these values uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT1_BUFFER_F32 (STREAM_OUT#(0:3)_BUFFER_F32@1)

Address: 4402

```
property stream_out1_buffer_status: int
```

The number of values in the buffer that are not currently being used.

Register: STREAM_OUT1_BUFFER_STATUS (STREAM_OUT#(0:3)_BUFFER_STATUS@1)

Address: 4082

```
property stream_out1_buffer_u16: int
```

Data destination when sending 16-bit integer data. Each value uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT1_BUFFER_U16 (STREAM_OUT#(0:3)_BUFFER_U16@1)

Address: 4421

```
property stream_out1_buffer_u32: int
```

Not used at this time. There are no U32 registers supported in stream-out. This register is a buffer.

Register: STREAM_OUT1_BUFFER_U32 (STREAM_OUT#(0:3)_BUFFER_U32@1)

Address: 4412

```
property stream_out1_enable: int
```

When STREAM_OUT#_ENABLE is enabled, the stream out target is generally updated by one value from the stream out buffer per stream scan. For example, there will generally be one instance of e.g. STREAM_OUT0 in the stream scan list, which will cause one STREAM_OUT0_BUFFER value to be consumed and written to STREAM_OUT0_TARGET for every stream scan. The stream scan list could also contain two instances of STREAM_OUT0, in which case two values from STREAM_OUT0_BUFFER value would be consumed and written for every stream scan.

Register: STREAM_OUT1_ENABLE (STREAM_OUT#(0:3)_ENABLE@1)

Address: 4092

```
property stream_out1_loop_num_values: int
```

The number of values, from the end of the array, that will be repeated after reaching the end of supplied data array.

Register: STREAM_OUT1_LOOP_NUM_VALUES (STREAM_OUT#(0:3)_LOOP_NUM_VALUES@1)

Address: 4062

```
property stream_out1_set_loop: int
```

Controls when new data and loop size are used. 1=Use new data immediately. 2=Wait for synch. New data will not be used until a different stream-out channel is set to Synch. 3=Synch. This stream-out# as well as any stream-outs set to synch will start using new data immediately.

Register: STREAM_OUT1_SET_LOOP (STREAM_OUT#(0:3)_SET_LOOP@1)

Address: 4072

```
property stream_out1_target: int
```

Channel that data will be written to. Before writing data to _BUFFER_###, you must write to _TARGET so the device knows how to interpret and store values.

Register: STREAM_OUT1_TARGET (STREAM_OUT#(0:3)_TARGET@1)

Address: 4042

```
property stream_out2: int
```

127) to trigger stream-out updates. When added to the scan list these do count against the max scan rate just like normal input addresses, but they do not return any data in the stream read.

Register: STREAM_OUT2 (STREAM_OUT#(0:3)@2)

Address: 4802

Type:
Include one or more of these registers in STREAM_SCANLIST_ADDRESS#(0

```
property stream_out2_buffer_allocate_num_bytes: int
```

Size of the buffer in bytes as a power of 2. Should be at least twice the size of updates that will be written and no less than 32. The usable buffer size will be equal to the value of this register minus 2 bytes (one 16-bit sample). Before writing data to _BUFFER_###, you must write to _BUFFER_ALLOCATE_NUM_BYTES to allocate RAM for the data. Max is 16384.

Register: STREAM_OUT2_BUFFER_ALLOCATE_NUM_BYTES (STREAM_OUT#(0:3)_BUFFER_ALLOCATE_NUM_BYTES@2)

Address: 4054

```
property stream_out2_buffer_f32: float
```

Data destination when sending floating point data. Appropriate cal constants are used to convert F32 values to 16-bit binary data, and thus each of these values uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT2_BUFFER_F32 (STREAM_OUT#(0:3)_BUFFER_F32@2)

Address: 4404

```
property stream_out2_buffer_status: int
```

The number of values in the buffer that are not currently being used.

Register: STREAM_OUT2_BUFFER_STATUS (STREAM_OUT#(0:3)_BUFFER_STATUS@2)

Address: 4084

```
property stream_out2_buffer_u16: int
```

Data destination when sending 16-bit integer data. Each value uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT2_BUFFER_U16 (STREAM_OUT#(0:3)_BUFFER_U16@2)

Address: 4422

```
property stream_out2_buffer_u32: int
```

Not used at this time. There are no U32 registers supported in stream-out. This register is a buffer.

Register: STREAM_OUT2_BUFFER_U32 (STREAM_OUT#(0:3)_BUFFER_U32@2)

Address: 4414

```
property stream_out2_enable: int
```

When STREAM_OUT#_ENABLE is enabled, the stream out target is generally updated by one value from the stream out buffer per stream scan. For example, there will generally be one instance of e.g. STREAM_OUT0 in the stream scan list, which will cause one STREAM_OUT0_BUFFER value to be consumed and written to STREAM_OUT0_TARGET for every stream scan. The stream scan list could also contain two instances of STREAM_OUT0, in which case two values from STREAM_OUT0_BUFFER value would be consumed and written for every stream scan.

```
property stream_out3_loop_num_values: int
```

The number of values, from the end of the array, that will be repeated after reaching the end of supplied data array.

Register: STREAM_OUT3_LOOP_NUM_VALUES (STREAM_OUT#(0:3)_LOOP_NUM_VALUES@3)

Address: 4066

```
property stream_out3_set_loop: int
```

Controls when new data and loop size are used. 1=Use new data immediately. 2=Wait for synch. New data will not be used until a different stream-out channel is set to Synch. 3=Synch. This stream-out# as well as any stream-outs set to synch will start using new data immediately.

Register: STREAM_OUT3_SET_LOOP (STREAM_OUT#(0:3)_SET_LOOP@3)

Address: 4076

```
property stream_out3_target: int
```

Channel that data will be written to. Before writing data to _BUFFER_###, you must write to _TARGET so the device knows how to interpret and store values.

Register: STREAM_OUT3_TARGET (STREAM_OUT#(0:3)_TARGET@3)

Address: 4046

```
property stream_resolution_index: int
```

The resolution index for stream readings. A larger resolution index generally results in lower noise and longer sample times.

Register: STREAM_RESOLUTION_INDEX

Address: 4010

```
property stream_samples_per_packet: int
```

Specifies the number of data points to be sent in the data packet. Only applies to spontaneous mode.

Register: STREAM_SAMPLES_PER_PACKET

Address: 4006

```
property stream_scanlist_address0: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS0 (STREAM_SCANLIST_ADDRESS#(0:127)@0)

Address: 4100

```
property stream_scanlist_address1: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS1 (STREAM_SCANLIST_ADDRESS#(0:127)@1)

Address: 4102

```
property stream_scanlist_address10: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS10 (STREAM_SCANLIST_ADDRESS#(0:127)@10)

Address: 4120

```
property stream_scanlist_address100: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS100 (STREAM_SCANLIST_ADDRESS#(0:127)@100)

Address: 4300

```
property stream_scanlist_address101: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS101 (STREAM_SCANLIST_ADDRESS#(0:127)@101)

Address: 4302

```
property stream_scanlist_address102: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS102 (STREAM_SCANLIST_ADDRESS#(0:127)@102)

Address: 4304

Address: 4244

```
property stream_scanlist_address73: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS73 (STREAM_SCANLIST_ADDRESS#(0:127)@73)

Address: 4246

```
property stream_scanlist_address74: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS74 (STREAM_SCANLIST_ADDRESS#(0:127)@74)

Address: 4248

```
property stream_scanlist_address75: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS75 (STREAM_SCANLIST_ADDRESS#(0:127)@75)

Address: 4250

```
property stream_scanlist_address76: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS76 (STREAM_SCANLIST_ADDRESS#(0:127)@76)

Address: 4252

```
property stream_scanlist_address77: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS77 (STREAM_SCANLIST_ADDRESS#(0:127)@77)

Address: 4254

```
property stream_scanlist_address78: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS78 (STREAM_SCANLIST_ADDRESS#(0:127)@78)

Address: 4256

```
property stream_scanlist_address79: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS79 (STREAM_SCANLIST_ADDRESS#(0:127)@79)

Address: 4258

```
property stream_scanlist_address8: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS8 (STREAM_SCANLIST_ADDRESS#(0:127)@8)

Address: 4116

```
property stream_scanlist_address80: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS80 (STREAM_SCANLIST_ADDRESS#(0:127)@80)

Address: 4260

```
property stream_scanlist_address81: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS81 (STREAM_SCANLIST_ADDRESS#(0:127)@81)

Address: 4262

```
property stream_scanlist_address82: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS82 (STREAM_SCANLIST_ADDRESS#(0:127)@82)

Address: 4264

```
property stream_scanlist_address83: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS83 (STREAM_SCANLIST_ADDRESS#(0:127)@83)

Address: 4266

```
property stream_scanlist_address84: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS84 (STREAM_SCANLIST_ADDRESS#(0:127)@84)

Address: 4268

```
property stream_scanlist_address85: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS85 (STREAM_SCANLIST_ADDRESS#(0:127)@85)

Address: 4270

```
property stream_scanlist_address86: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS86 (STREAM_SCANLIST_ADDRESS#(0:127)@86)

Address: 4272

```
property stream_scanlist_address87: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS87 (STREAM_SCANLIST_ADDRESS#(0:127)@87)

Address: 4274

```
property stream_scanlist_address88: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS88 (STREAM_SCANLIST_ADDRESS#(0:127)@88)

Address: 4276

```
property stream_scanlist_address89: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS89 (STREAM_SCANLIST_ADDRESS#(0:127)@89)

Address: 4278

```
property stream_scanlist_address9: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS9 (STREAM_SCANLIST_ADDRESS#(0:127)@9)

Address: 4118

```
property stream_scanlist_address90: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS90 (STREAM_SCANLIST_ADDRESS#(0:127)@90)

Address: 4280

```
property stream_scanlist_address91: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS91 (STREAM_SCANLIST_ADDRESS#(0:127)@91)

Address: 4282

```
property stream_scanlist_address92: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS92 (STREAM_SCANLIST_ADDRESS#(0:127)@92)

Address: 4284

```
property stream_scanlist_address93: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS93 (STREAM_SCANLIST_ADDRESS#(0:127)@93)

Address: 4286

```
property stream_scanlist_address94: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS94 (STREAM_SCANLIST_ADDRESS#(0:127)@94)

Address: 4288

```
property stream_scanlist_address95: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS95 (STREAM_SCANLIST_ADDRESS#(0:127)@95)

Address: 4290

```
property stream_scanlist_address96: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS96 (STREAM_SCANLIST_ADDRESS#(0:127)@96)

Address: 4292

```
property stream_scanlist_address97: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS97 (STREAM_SCANLIST_ADDRESS#(0:127)@97)

Address: 4294

```
property stream_scanlist_address98: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS98 (STREAM_SCANLIST_ADDRESS#(0:127)@98)

Address: 4296

```
property stream_scanlist_address99: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS99 (STREAM_SCANLIST_ADDRESS#(0:127)@99)

Address: 4298

```
property stream_scanrate_hz: float
```

Write a value to specify the number of times per second that all channels in the stream scanlist will be read. Max stream speeds are based on Sample Rate which is NumChannels*ScanRate. Has no effect when using an external clock. A read of this register returns the actual scan rate, which can be slightly different due to rounding. For scan rates >152.588, the actual scan interval is multiples of 100 ns. Assuming a core clock of 80 MHz the

internal roll value is (80M/(8*DesiredScanRate))-1 and the actual scan rate is then 80M/(8*(RollValue+1). For slower scan rates the scan interval resolution is changed to 1 us, 10 us, 100 us, or 1 ms as needed to achieve the longer intervals.

Register: STREAM_SCANRATE_HZ

Address: 4002

```
property stream_settling_us: float
```

Time in microseconds to allow signals to settle after switching the mux. Does not apply to the 1st channel in the scan list, as that settling is controlled by scan rate (the time from the last channel until the start of the next scan). Default=0. When set to less than 1, automatic settling will be used. The automatic settling behavior varies by device.

Register: STREAM_SETTLING_US

Address: 4008

```
property stream_start_time_stamp: int
```

This register stores the value of CORE_TIMER at the start of the first stream scan. Note that the first stream scan happens 1 scan period after STREAM_ENABLE is set to 1.

Register: STREAM_START_TIME_STAMP

Address: 4026

```
property system_counter_10khz: int
```

A 10 kHz counter synchronized to RTC_TIME_S. This register can be appended to RTC_TIME_S as the decimal portion to get 0.1 ms resolution.

Register: SYSTEM_COUNTER_10KHZ

Address: 61502

```
property system_reboot: int
```

Issues a device reboot. Must write 0x4C4Axxxx, where xxxx is number of 50ms ticks to wait before reboot. To reboot immediately write 0x4C4A0000 (d1279918080).

Register: SYSTEM_REBOOT

Address: 61998

```
property system_timer_20hz: int
```

Internal 32-bit system timer running at 20Hz.

Register: SYSTEM_TIMER_20HZ

Address: 61522

```
property tdac0: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC0 (TDAC#(0:21)@0)

Address: 30000

```
property tdac1: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC1 (TDAC#(0:21)@1)

Address: 30002

```
property tdac10: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC10 (TDAC#(0:21)@10)

Address: 30020

```
property tdac11: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC11 (TDAC#(0:21)@11)

Address: 30022

```
property tdac4: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC4 (TDAC#(0:21)@4)

Address: 30008

```
property tdac5: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC5 (TDAC#(0:21)@5)

Address: 30010

```
property tdac6: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC6 (TDAC#(0:21)@6)

Address: 30012

```
property tdac7: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC7 (TDAC#(0:21)@7)

Address: 30014

```
property tdac8: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC8 (TDAC#(0:21)@8)

Address: 30016

```
property tdac9: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC9 (TDAC#(0:21)@9)

Address: 30018

```
property tdac_serial_number: int
```

Returns the serial number of an LJTick-DAC, and forces a re-read of the calibration constants. Which LJTDAC is determined by the last write to TDAC# ... whether it was successful or not.

Register: TDAC_SERIAL_NUMBER

Address: 55200

```
property tdac_speed_throttle: int
```

Sets the I2C clock speed that will be used when communicating with the TDAC. Default value is 65516. See I2C_SPEED_THROTTLE for more detail.

Register: TDAC_SPEED_THROTTLE

Address: 55202

```
property temperature_air_k: float
```

Returns the estimated ambient air temperature just outside of the device in its red plastic enclosure. This register is equal to TEMPERATURE_DEVICE_K - 4.3. If Ethernet and/or WiFi is enabled, subtract an extra 0.6 for each.

Register: TEMPERATURE_AIR_K

Address: 60050

```
property temperature_device_k: float
```

Takes a reading from the internal temperature sensor using range=+/-10V and resolution=8, and applies the formula Volts*-92.6+467.6 to return kelvins.

Register: TEMPERATURE_DEVICE_K

Address: 60052

```
property test: int
```

A read of this test register should always return 0x00112233 or d1122867. If your software has the word swap quirk, you will incorrectly read 0x22330011 or 573767697. If your software has the address-1 quirk, a UINT16 (1-register) read from 55101 will incorrectly return 0x0011 (should read 0x2233). This register is unlike others, in that it allows you can read a single word from 55100 or 55101, or of course 2 words from 55100.

Register: TEST

Address: 55100

```
property test_float32: float
```

Write a value and read back to test FLOAT32 operation. Default is 0xC61C3C00 or -9999.0. If your software has the word swap quirk, the default will incorrectly read 0x3C00C61C or 0.00786.

Register: TEST_FLOAT32

Address: 55124

```
property test_int32: int
```

Write a value and read back to test INT32 operation. Default is 0x8899AABB or d-2003195205. If your software has the word swap quirk, the default will incorrectly read 0xAABB8899 or -1430550375.

Register: TEST_INT32

Address: 55122

```
property test_uint16: int
```

Write a value and read back to test UINT16 operation. Default is 0x0011 or d17.

Register: TEST_UINT16

Address: 55110

```
property test_uint32: int
```

Write a value and read back to test UINT32 operation. Default is 0x00112233 or d1122867. If your software has the word swap quirk, the default will incorrectly read 0x22330011 or 573767697.

Register: TEST_UINT32

```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM13_U32 (USER_RAM#(0:39)_U32@13)

Address: 46126

```
property user_ram14_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM14_F32 (USER_RAM#(0:39)_F32@14)

Address: 46028

```
property user_ram14_u16: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM14_U16 (USER_RAM#(0:19)_U16@14)

Address: 46194

```
property user_ram14_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM14_U32 (USER_RAM#(0:39)_U32@14)

Address: 46128

```
property user_ram15_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM15_F32 (USER_RAM#(0:39)_F32@15)

Address: 46030

```
property user_ram15_u16: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM15_U16 (USER_RAM#(0:19)_U16@15)

Address: 46195

```
property user_ram15_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM15_U32 (USER_RAM#(0:39)_U32@15)

Address: 46130

```
property user_ram16_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM16_F32 (USER_RAM#(0:39)_F32@16)

Address: 46032

```
property user_ram16_u16: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM16_U16 (USER_RAM#(0:19)_U16@16)

Address: 46196

```
property user_ram16_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM16_U32 (USER_RAM#(0:39)_U32@16)

Address: 46132

```
property user_ram17_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM17_F32 (USER_RAM#(0:39)_F32@17)

Address: 46034

```
property user_ram17_u16: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM17_U16 (USER_RAM#(0:19)_U16@17)

Address: 46197

```
property user_ram17_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

property user_ram9_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM9_F32 (USER_RAM#(0:39)_F32@9)

Address: 46018

```
property user_ram9_i32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM9_I32 (USER_RAM#(0:9)_I32@9)

Address: 46098

```
property user_ram9_u16: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM9_U16 (USER_RAM#(0:19)_U16@9)

Address: 46189

```
property user_ram9_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM9_U32 (USER_RAM#(0:39)_U32@9)

Address: 46118

```
property user_ram_fifo0_allocate_num_bytes: int
```

Allocate memory for a FIFO buffer. Number of bytes should be sufficient to store users max transfer array size. Note that FLOAT32, INT32, and UINT32 require 4 bytes per value, and UINT16 require 2 bytes per value. Maximum size is limited by available memory. Care should be taken to conserve enough memory for other operations such as AIN_EF, Lua, Stream etc.

Register: USER_RAM_FIFO0_ALLOCATE_NUM_BYTES
(USER_RAM_FIFO#(0:3)_ALLOCATE_NUM_BYTES@0)

Address: 47900

```
property user_ram_fifo0_data_f32: float
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO0_DATA_F32 (USER_RAM_FIFO#(0:3)_DATA_F32@0)

Address: 47030

```
property user_ram_fifo0_data_i32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO0_DATA_I32 (USER_RAM_FIFO#(0:3)_DATA_I32@0)

Address: 47020

```
property user_ram_fifo0_data_u16: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO0_DATA_U16 (USER_RAM_FIFO#(0:3)_DATA_U16@0)

Address: 47000

```
property user_ram_fifo0_data_u32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO0_DATA_U32 (USER_RAM_FIFO#(0:3)_DATA_U32@0)

Address: 47010

```
property user_ram_fifo0_empty: int
```

Write any value to this register to efficiently empty, flush, or otherwise clear data from the FIFO.

Register: USER_RAM_FIFO0_EMPTY (USER_RAM_FIFO#(0:3)_EMPTY@0)

Address: 47930

```
property user_ram_fifo0_num_bytes_in_fifo: int
```

Poll this register to see when new data is available/ready. Each read of the FIFO buffer decreases this value, and each write to the FIFO buffer increases this value.

At any point in time, the following equation holds: Nbytes = Nwritten - Nread.

Register: USER_RAM_FIFO0_NUM_BYTES_IN_FIFO
(USER_RAM_FIFO#(0:3)_NUM_BYTES_IN_FIFO@0)

Address: 47910

```
property user_ram_fifo1_allocate_num_bytes: int
```

Allocate memory for a FIFO buffer. Number of bytes should be sufficient to store users max transfer array size. Note that FLOAT32, INT32, and UINT32 require 4 bytes per value, and UINT16 require 2 bytes per value. Maximum size is limited by available memory. Care should be taken to conserve enough memory for other operations such as AIN_EF, Lua, Stream etc.

Register: USER_RAM_FIFO1_ALLOCATE_NUM_BYTES
(USER_RAM_FIFO#(0:3)_ALLOCATE_NUM_BYTES@1)

Address: 47902

```
property user_ram_fifo1_data_f32: float
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO1_DATA_F32 (USER_RAM_FIFO#(0:3)_DATA_F32@1)

Address: 47032

```
property user_ram_fifo1_data_i32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO1_DATA_I32 (USER_RAM_FIFO#(0:3)_DATA_I32@1)

Address: 47022

```
property user_ram_fifo1_data_u16: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO1_DATA_U16 (USER_RAM_FIFO#(0:3)_DATA_U16@1)

Address: 47001

```
property user_ram_fifo1_data_u32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO1_DATA_U32 (USER_RAM_FIFO#(0:3)_DATA_U32@1)

Address: 47012

```
property user_ram_fifo1_empty: int
```

Write any value to this register to efficiently empty, flush, or otherwise clear data from the FIFO.

Register: USER_RAM_FIFO1_EMPTY (USER_RAM_FIFO#(0:3)_EMPTY@1)

Address: 47932

```
property user_ram_fifo1_num_bytes_in_fifo: int
```

Poll this register to see when new data is available/ready. Each read of the FIFO buffer decreases this value, and each write to the FIFO buffer increases this value.

At any point in time, the following equation holds: Nbytes = Nwritten - Nread.

Register: USER_RAM_FIFO1_NUM_BYTES_IN_FIFO
(USER_RAM_FIFO#(0:3)_NUM_BYTES_IN_FIFO@1)

Address: 47912

```
property user_ram_fifo2_allocate_num_bytes: int
```

Allocate memory for a FIFO buffer. Number of bytes should be sufficient to store users max transfer array size. Note that FLOAT32, INT32, and UINT32 require 4 bytes per value, and UINT16 require 2 bytes per value. Maximum size is limited by available memory. Care should be taken to conserve enough memory for other operations such as AIN_EF, Lua, Stream etc.

Register: USER_RAM_FIFO2_ALLOCATE_NUM_BYTES
(USER_RAM_FIFO#(0:3)_ALLOCATE_NUM_BYTES@2)

Address: 47904

```
property user_ram_fifo2_data_f32: float
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO2_DATA_F32 (USER_RAM_FIFO#(0:3)_DATA_F32@2)

Address: 47034

```
property user_ram_fifo2_data_i32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO2_DATA_I32 (USER_RAM_FIFO#(0:3)_DATA_I32@2)

Address: 47024

```
property user_ram_fifo2_data_u16: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO2_DATA_U16 (USER_RAM_FIFO#(0:3)_DATA_U16@2)

Address: 47002

```
property user_ram_fifo2_data_u32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO2_DATA_U32 (USER_RAM_FIFO#(0:3)_DATA_U32@2)

Address: 47014

```
property user_ram_fifo2_empty: int
```

Write any value to this register to efficiently empty, flush, or otherwise clear data from the FIFO.

Register: USER_RAM_FIFO2_EMPTY (USER_RAM_FIFO#(0:3)_EMPTY@2)

Address: 47934

```
property user_ram_fifo2_num_bytes_in_fifo: int
```

Poll this register to see when new data is available/ready. Each read of the FIFO buffer decreases this value, and each write to the FIFO buffer increases this value.

At any point in time, the following equation holds: Nbytes = Nwritten - Nread.

Register: USER_RAM_FIFO2_NUM_BYTES_IN_FIFO
(USER_RAM_FIFO#(0:3)_NUM_BYTES_IN_FIFO@2)

Address: 47914

```
property user_ram_fifo3_allocate_num_bytes: int
```

Allocate memory for a FIFO buffer. Number of bytes should be sufficient to store users max transfer array size. Note that FLOAT32, INT32, and UINT32 require 4 bytes per value, and UINT16 require 2 bytes per value. Maximum size is limited by available memory. Care should be taken to conserve enough memory for other operations such as AIN_EF, Lua, Stream etc.

Register: USER_RAM_FIFO3_ALLOCATE_NUM_BYTES
(USER_RAM_FIFO#(0:3)_ALLOCATE_NUM_BYTES@3)

Address: 47906

```
property user_ram_fifo3_data_f32: float
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO3_DATA_F32 (USER_RAM_FIFO#(0:3)_DATA_F32@3)

Address: 47036

```
property user_ram_fifo3_data_i32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO3_DATA_I32 (USER_RAM_FIFO#(0:3)_DATA_I32@3)

Address: 47026

```
property user_ram_fifo3_data_u16: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO3_DATA_U16 (USER_RAM_FIFO#(0:3)_DATA_U16@3)

Address: 47003

```
property user_ram_fifo3_data_u32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO3_DATA_U32 (USER_RAM_FIFO#(0:3)_DATA_U32@3)

Address: 47016

```
property user_ram_fifo3_empty: int
```

Write any value to this register to efficiently empty, flush, or otherwise clear data from the FIFO.

Register: USER_RAM_FIFO3_EMPTY (USER_RAM_FIFO#(0:3)_EMPTY@3)

Address: 47936

```
property user_ram_fifo3_num_bytes_in_fifo: int
```

Poll this register to see when new data is available/ready. Each read of the FIFO buffer decreases this value, and each write to the FIFO buffer increases this value.

At any point in time, the following equation holds: Nbytes = Nwritten - Nread.

Register: USER_RAM_FIFO3_NUM_BYTES_IN_FIFO
(USER_RAM_FIFO#(0:3)_NUM_BYTES_IN_FIFO@3)

Address: 47916

```
property wait_us_blocking: int
```

Delays for x microseconds. Range is 0-100000. This operation is Blocking. While a blocking function is running no other registers can be read / written.

Register: WAIT_US_BLOCKING

Address: 61590

```
property watchdog_advanced_default: int
```

A single binary-encoded value where each bit is an advanced option. If bit 0 is set, IO_CONFIG_SET_CURRENT_TO_FACTORY will be done on timeout. If bit 1 is set, IO_CONFIG_SET_CURRENT_TO_DEFAULT will be done on timeout.

Register: WATCHDOG_ADVANCED_DEFAULT

Address: 61602

```
property watchdog_dac0_default: float
```

The voltage of DAC0 after a Watchdog timeout.

Register: WATCHDOG_DAC0_DEFAULT

Address: 61642

```
property watchdog_dac0_enable_default: int
```

Timeout action: Set to 1 to enable DAC0 update on watchdog timeout.

Register: WATCHDOG_DAC0_ENABLE_DEFAULT

Address: 61640

```
property watchdog_dac1_default: float
```

The voltage of DAC1 after a Watchdog timeout.

Register: WATCHDOG_DAC1_DEFAULT

Address: 61652

```
property watchdog_dac1_enable_default: int
```

Timeout action: Set to 1 to enable DAC1 update on watchdog timeout.

Register: WATCHDOG_DAC1_ENABLE_DEFAULT

Address: 61650

```
property watchdog_dio_direction_default: int
```

The direction input/output of the digital I/O after a Watchdog timeout. See DIO_DIRECTION.

Register: WATCHDOG_DIO_DIRECTION_DEFAULT

Address: 61634

```
property watchdog_dio_enable_default: int
```

Timeout action: Set to 1 to enable DIO update on watchdog timeout.

Register: WATCHDOG_DIO_ENABLE_DEFAULT

Address: 61630

```
property watchdog_dio_inhibit_default: int
```

This register can be used to prevent the watchdog from changing specific IO. See DIO_INHIBIT for more information.

Register: WATCHDOG_DIO_INHIBIT_DEFAULT

Address: 61636

```
property watchdog_dio_state_default: int
```

The state high/low of the digital I/O after a Watchdog timeout. See DIO_STATE.

Register: WATCHDOG_DIO_STATE_DEFAULT

Address: 61632

```
property watchdog_enable_default: int
```

Write a 1 to enable the watchdog or a 0 to disable. The watchdog must be disabled before writing any of the other watchdog registers (except for WATCHDOG_STRICT_CLEAR).

Register: WATCHDOG_ENABLE_DEFAULT

Address: 61600

```
property watchdog_reset_enable_default: int
```

Timeout action: Set to 1 to enable device-reset on watchdog timeout.

Register: WATCHDOG_RESET_ENABLE_DEFAULT

Address: 61620

```
property watchdog_startup_delay_s_default: int
```

This specifies the initial timeout period at device bootup. This is used until the first time the watchdog is cleared or timeout ... after that the normal timeout is used.

Register: WATCHDOG_STARTUP_DELAY_S_DEFAULT

Address: 61606

```
property watchdog_strict_clear: int
```

When running in strict mode, writing the key to this register is the only way to clear the watchdog. Writing to this register while not using strict mode will clear the watchdog.

Register: WATCHDOG_STRICT_CLEAR

Address: 61614

```
property watchdog_strict_enable_default: int
```

Set to 1 to enable strict mode.

Register: WATCHDOG_STRICT_ENABLE_DEFAULT

Address: 61610

```
property watchdog_strict_key_default: int
```

When set to strict mode, this is the value that must be written to the clear register.

Register: WATCHDOG_STRICT_KEY_DEFAULT

Address: 61612

```
property watchdog_timeout_s_default: int
```

When the device receives any communication over USB/Ethernet/WiFi, the watchdog timer is cleared. If the watchdog timer is not cleared within the timeout period, the enabled actions will be done.

Register: WATCHDOG_TIMEOUT_S_DEFAULT

Address: 61604

LabJack T7/T7-Pro

```
class htf.labjack.T7(*, name: str | None = None, host: str | None = None, port: int = 502,
debuglevel: int = 0, timeout: float = 1.0, retries: int = 0)
```

LabJack adapter for the T7 and T7-Pro.

Parameters:

- **name** – If name is set the USB device's name is checked against it. If host is None a USB device is opened.
- **host** – If host is set a Modbus-TCP connection is opened. Name must not be set at the same time.
- **port** – The Modbus-TCP port to be used
- **debuglevel** – If set the Modbus packets are printed
- **timeout** – The timeout for every request
- **retries** – The number of retries for Modbus communication

```
property ain0: float
```

Returns the voltage of the specified analog input.

Register: AIN0 (AIN#(0:13)@0)

Address: 0

```
property ain0_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN0_BINARY (AIN#(0:13)_BINARY@0)

Address: 50000

```
property ain0_ef_config_a: int
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_A (AIN#(0:149)_EF_CONFIG_A@0)

Address: 9300

```
property ain0_ef_config_b: int
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_B (AIN#(0:149)_EF_CONFIG_B@0)

Address: 9600

```
property ain0_ef_config_c: int
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_C (AIN#(0:149)_EF_CONFIG_C@0)

Address: 9900

```
property ain0_ef_config_d: float
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_D (AIN#(0:149)_EF_CONFIG_D@0)

Address: 10200

```
property ain0_ef_config_e: float
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_E (AIN#(0:149)_EF_CONFIG_E@0)

Address: 10500

```
property ain0_ef_config_f: float
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_F (AIN#(0:149)_EF_CONFIG_F@0)

Address: 10800

```
property ain0_ef_config_g: float
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_G (AIN#(0:149)_EF_CONFIG_G@0)

Address: 11100

```
property ain0_ef_config_h: float
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_H (AIN#(0:149)_EF_CONFIG_H@0)

Address: 11400

```
property ain0_ef_config_i: float
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_I (AIN#(0:149)_EF_CONFIG_I@0)

Address: 11700

```
property ain0_ef_config_j: float
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_J (AIN#(0:149)_EF_CONFIG_J@0)

Address: 12000

```
property ain0_ef_index: int
```

Specify the desired extended feature for this analog input with the index value. List of index values: 0=None(disabled); 1=Offset and Slope; 3=Max/Min/Avg; 4=Resistance; 5=Average and Threshold; 10=RMS Flex; 11=FlexRMS; 20=Thermocouple type E; 21=Thermocouple type J; 22=Thermocouple type K; 23=Thermocouple type R; 24=Thermocouple type T; 25=Thermocouple type S; 27=Thermocouple type N; 28=Thermocouple type B; 30=Thermocouple type C; 40=RTD model PT100; 41=RTD model PT500; 42=RTD model PT1000; 50=Thermistor Steinhart-Hart; 51=Thermistor Beta.

Register: AIN0_EF_INDEX (AIN#(0:149)_EF_INDEX@0)

Address: 9000

```
property ain0_ef_read_a: float
```

Function dependent on selected feature index.

Register: AIN0_EF_READ_A (AIN#(0:149)_EF_READ_A@0)

Address: 7000

```
property ain0_ef_read_b: float
```

Function dependent on selected feature index.

Register: AIN0_EF_READ_B (AIN#(0:149)_EF_READ_B@0)

Address: 7300

```
property ain0_ef_read_c: float
```

Function dependent on selected feature index.

Register: AIN0_EF_READ_C (AIN#(0:149)_EF_READ_C@0)

Address: 7600

```
property ain0_ef_read_d: float
```

Function dependent on selected feature index.

Register: AIN0_EF_READ_D (AIN#(0:149)_EF_READ_D@0)

Address: 7900

```
property ain0_negative_ch: int
```

Specifies the negative channel to be used for each positive channel. 199=Default=> Single-Ended.

Register: AIN0_NEGATIVE_CH (AIN#(0:13)_NEGATIVE_CH@0)

Address: 41000

```
property ain0_range: float
```

The range/span of each analog input. Write the highest expected input voltage.

Register: AIN0_RANGE (AIN#(0:13)_RANGE@0)

Address: 40000

```
property ain0_resolution_index: int
```

The resolution index for command-response and AIN-EF readings. A larger resolution index generally results in lower noise and longer sample times.

Register: AIN0_RESOLUTION_INDEX (AIN#(0:13)_RESOLUTION_INDEX@0)

Address: 41500

```
property ain0_settling_us: float
```

Settling time for command-response and AIN-EF readings.

Register: AIN0_SETTLING_US (AIN#(0:13)_SETTLING_US@0)

Address: 42000

```
property ain1: float
```

Returns the voltage of the specified analog input.

Register: AIN1 (AIN#(0:13)@1)

Address: 2

```
property ain10: float
```

Returns the voltage of the specified analog input.

Register: AIN10 (AIN#(0:13)@10)

Address: 20

```
property ain100: float
```

Returns the voltage of the specified analog input.

Register: AIN100 (AIN#(48:127)@100)

Address: 200

```
property ain100_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN100_BINARY (AIN#(48:127)_BINARY@100)

Address: 50200

```
property ain100_ef_config_a: int
```

Function dependent on selected feature index.

Register: AIN100_EF_CONFIG_A (AIN#(0:149)_EF_CONFIG_A@100)

Address: 9500

```
property ain100_ef_config_b: int
```

Function dependent on selected feature index.

Register: AIN100_EF_CONFIG_B (AIN#(0:149)_EF_CONFIG_B@100)

Address: 9800

```
property ain100_ef_config_c: int
```

Function dependent on selected feature index.

Register: AIN100_EF_CONFIG_C (AIN#(0:149)_EF_CONFIG_C@100)

Address: 10100

```
property ain100_ef_config_d: float
```

Function dependent on selected feature index.

Register: AIN100_EF_CONFIG_D (AIN#(0:149)_EF_CONFIG_D@100)

Address: 10400

```
property ain100_ef_config_e: float
```

Function dependent on selected feature index.

Register: AIN100_EF_CONFIG_E (AIN#(0:149)_EF_CONFIG_E@100)

Address: 10700

```
property ain100_ef_config_f: float
```

Function dependent on selected feature index.

Register: AIN100_EF_CONFIG_F (AIN#(0:149)_EF_CONFIG_F@100)

Address: 11000

```
property ain100_ef_config_g: float
```

Function dependent on selected feature index.

Register: AIN100_EF_CONFIG_G (AIN#(0:149)_EF_CONFIG_G@100)

Address: 11300

```
property ain100_ef_config_h: float
```

Function dependent on selected feature index.

Register: AIN100_EF_CONFIG_H (AIN#(0:149)_EF_CONFIG_H@100)

Address: 11600

```
property ain100_ef_config_i: float
```

Function dependent on selected feature index.

Register: AIN100_EF_CONFIG_I (AIN#(0:149)_EF_CONFIG_I@100)

Address: 11900

```
property ain100_ef_config_j: float
```

Function dependent on selected feature index.

Register: AIN100_EF_CONFIG_J (AIN#(0:149)_EF_CONFIG_J@100)

Address: 12200

```
property ain100_ef_index: int
```

Specify the desired extended feature for this analog input with the index value. List of index values: 0=None(disabled); 1=Offset and Slope; 3=Max/Min/Avg; 4=Resistance; 5=Average and Threshold; 10=RMS Flex; 11=FlexRMS; 20=Thermocouple type E; 21=Thermocouple type J; 22=Thermocouple type K; 23=Thermocouple type R; 24=Thermocouple type T; 25=Thermocouple type S; 27=Thermocouple type N; 28=Thermocouple type B; 30=Thermocouple type C; 40=RTD model PT100; 41=RTD model PT500; 42=RTD model PT1000; 50=Thermistor Steinhart-Hart; 51=Thermistor Beta.

Register: AIN100_EF_INDEX (AIN#(0:149)_EF_INDEX@100)

Address: 9200

```

The resolution index for command-response and AIN-EF readings. A larger resolution index generally results in lower noise and longer sample times.

Register: AIN108_RESOLUTION_INDEX (AIN#(48:127)_RESOLUTION_INDEX@108)

Address: 41608

```
property ain108_settling_us: float
```

Settling time for command-response and AIN-EF readings.

Register: AIN108_SETTLING_US (AIN#(48:127)_SETTLING_US@108)

Address: 42216

```
property ain109: float
```

Returns the voltage of the specified analog input.

Register: AIN109 (AIN#(48:127)@109)

Address: 218

```
property ain109_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN109_BINARY (AIN#(48:127)_BINARY@109)

Address: 50218

```
property ain109_ef_config_a: int
```

Function dependent on selected feature index.

Register: AIN112_EF_READ_D (AIN#(0:149)_EF_READ_D@112)

Address: 8124

```
property ain112_negative_ch: int
```

Specifies the negative channel to be used for each positive channel. 199=Default=> Single-Ended.

Register: AIN112_NEGATIVE_CH (AIN#(48:127)_NEGATIVE_CH@112)

Address: 41112

```
property ain112_range: float
```

The range/span of each analog input. Write the highest expected input voltage.

Register: AIN112_RANGE (AIN#(48:127)_RANGE@112)

Address: 40224

```
property ain112_resolution_index: int
```

The resolution index for command-response and AIN-EF readings. A larger resolution index generally results in lower noise and longer sample times.

Register: AIN112_RESOLUTION_INDEX (AIN#(48:127)_RESOLUTION_INDEX@112)

Address: 41612

```
property ain112_settling_us: float
```

Settling time for command-response and AIN-EF readings.

Register: AIN112_SETTLING_US (AIN#(48:127)_SETTLING_US@112)

Address: 42224

```
property ain113: float
```

Returns the voltage of the specified analog input.

Register: AIN113 (AIN#(48:127)@113)

Address: 226

```
property ain113_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN113_BINARY (AIN#(48:127)_BINARY@113)

```

Returns the voltage of the specified analog input.

Register: AIN117 (AIN#(48:127)@117)

Address: 234

```
property ain117_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN117_BINARY (AIN#(48:127)_BINARY@117)

Address: 50234

```

property ain125_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

```

The resolution index for command-response and AIN-EF readings. A larger resolution index generally results in lower noise and longer sample times.

Register: AIN62_RESOLUTION_INDEX (AIN#(48:127)_RESOLUTION_INDEX@62)

Address: 41562

```
property ain62_settling_us: float
```

Settling time for command-response and AIN-EF readings.

Register: AIN62_SETTLING_US (AIN#(48:127)_SETTLING_US@62)

Address: 42124

```
property ain63: float
```

Returns the voltage of the specified analog input.

Register: AIN63 (AIN#(48:127)@63)

Address: 126

```
property ain63_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN63_BINARY (AIN#(48:127)_BINARY@63)

Address: 50126

```
property ain63_ef_config_a: int
```

Function dependent on selected feature index.

Register: AIN63_EF_CONFIG_A (AIN#(0:149)_EF_CONFIG_A@63)

Address: 9426

```
property ain63_ef_config_b: int
```

Function dependent on selected feature index.

Register: AIN63_EF_CONFIG_B (AIN#(0:149)_EF_CONFIG_B@63)

Address: 9726

```
property ain63_ef_config_c: int

```

The resolution index for command-response and AIN-EF readings. A larger resolution index generally results in lower noise and longer sample times.

Register: AIN75_RESOLUTION_INDEX (AIN#(48:127)_RESOLUTION_INDEX@75)

Address: 41575

```
property ain75_settling_us: float
```

Settling time for command-response and AIN-EF readings.

Register: AIN75_SETTLING_US (AIN#(48:127)_SETTLING_US@75)

Address: 42150

```
property ain76: float
```

Returns the voltage of the specified analog input.

Register: AIN76 (AIN#(48:127)@76)

Address: 152

```
property ain76_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN76_BINARY (AIN#(48:127)_BINARY@76)

Address: 50152

```
property ain76_ef_config_a: int
```

Function dependent on selected feature index.

Register: AIN76_EF_CONFIG_A (AIN#(0:149)_EF_CONFIG_A@76)

Address: 9452

```
property ain76_ef_config_b: int
```

Function dependent on selected feature index.

Register: AIN76_EF_CONFIG_B (AIN#(0:149)_EF_CONFIG_B@76)

Address: 9752

```
property ain76_ef_config_c: int
```

Function dependent on selected feature index.

Register: AIN76_EF_CONFIG_C (AIN#(0:149)_EF_CONFIG_C@76)

```
property ain7_ef_read_d: float
```

Function dependent on selected feature index.

Register: AIN7_EF_READ_D (AIN#(0:149)_EF_READ_D@7)

Address: 7914

```
property ain7_negative_ch: int
```

Specifies the negative channel to be used for each positive channel. 199=Default=> Single-Ended.

Register: AIN7_NEGATIVE_CH (AIN#(0:13)_NEGATIVE_CH@7)

Address: 41007

```
property ain7_range: float
```

The range/span of each analog input. Write the highest expected input voltage.

Register: AIN7_RANGE (AIN#(0:13)_RANGE@7)

Address: 40014

```
property ain7_resolution_index: int
```

The resolution index for command-response and AIN-EF readings. A larger resolution index generally results in lower noise and longer sample times.

Register: AIN7_RESOLUTION_INDEX (AIN#(0:13)_RESOLUTION_INDEX@7)

Address: 41507

```
property ain7_settling_us: float
```

Settling time for command-response and AIN-EF readings.

Register: AIN7_SETTLING_US (AIN#(0:13)_SETTLING_US@7)

Address: 42014

```
property ain8: float
```

Returns the voltage of the specified analog input.

Register: AIN8 (AIN#(0:13)@8)

Address: 16

```
property ain80: float
```

Returns the voltage of the specified analog input.

Register: AIN80 (AIN#(48:127)@80)

Address: 160

```
property ain80_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN80_BINARY (AIN#(48:127)_BINARY@80)

Address: 50160

```

property ain89_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

```
property ain92_ef_read_d: float
```

Function dependent on selected feature index.

Register: AIN92_EF_READ_D (AIN#(0:149)_EF_READ_D@92)

Address: 8084

```
property ain92_negative_ch: int
```

Specifies the negative channel to be used for each positive channel. 199=Default=> Single-Ended.

Register: AIN92_NEGATIVE_CH (AIN#(48:127)_NEGATIVE_CH@92)

Address: 41092

```
property ain92_range: float
```

The range/span of each analog input. Write the highest expected input voltage.

Register: AIN92_RANGE (AIN#(48:127)_RANGE@92)

Address: 40184

```
property ain92_resolution_index: int
```

The resolution index for command-response and AIN-EF readings. A larger resolution index generally results in lower noise and longer sample times.

Register: AIN92_RESOLUTION_INDEX (AIN#(48:127)_RESOLUTION_INDEX@92)

Address: 41592

```
property ain92_settling_us: float
```

Settling time for command-response and AIN-EF readings.

Register: AIN92_SETTLING_US (AIN#(48:127)_SETTLING_US@92)

Address: 42184

```
property ain93: float
```

Returns the voltage of the specified analog input.

Register: AIN93 (AIN#(48:127)@93)

Address: 186

```
property ain93_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Address: 7794

```
property ain97_ef_read_d: float
```

Function dependent on selected feature index.

Register: AIN97_EF_READ_D (AIN#(0:149)_EF_READ_D@97)

Address: 8094

```
property ain97_negative_ch: int
```

Specifies the negative channel to be used for each positive channel. 199=Default=> Single-Ended.

Register: AIN97_NEGATIVE_CH (AIN#(48:127)_NEGATIVE_CH@97)

Address: 41097

```
property ain97_range: float
```

The range/span of each analog input. Write the highest expected input voltage.

Register: AIN97_RANGE (AIN#(48:127)_RANGE@97)

Address: 40194

```
property ain97_resolution_index: int
```

The resolution index for command-response and AIN-EF readings. A larger resolution index generally results in lower noise and longer sample times.

Register: AIN97_RESOLUTION_INDEX (AIN#(48:127)_RESOLUTION_INDEX@97)

Address: 41597

```
property ain97_settling_us: float
```

Settling time for command-response and AIN-EF readings.

Register: AIN97_SETTLING_US (AIN#(48:127)_SETTLING_US@97)

Address: 42194

```
property ain98: float
```

Returns the voltage of the specified analog input.

Register: AIN98 (AIN#(48:127)@98)

Address: 196

```
property ain98_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN98_BINARY (AIN#(48:127)_BINARY@98)

Specifies the negative channel to be used for each positive channel. 199=Default=> Single-Ended.

Register: AIN9_NEGATIVE_CH (AIN#(0:13)_NEGATIVE_CH@9)

Address: 41009

```
property ain9_range: float
```

The range/span of each analog input. Write the highest expected input voltage.

Register: AIN9_RANGE (AIN#(0:13)_RANGE@9)

Address: 40018

```
property ain9_resolution_index: int
```

The resolution index for command-response and AIN-EF readings. A larger resolution index generally results in lower noise and longer sample times.

Register: AIN9_RESOLUTION_INDEX (AIN#(0:13)_RESOLUTION_INDEX@9)

Address: 41509

```
property ain9_settling_us: float
```

Settling time for command-response and AIN-EF readings.

Register: AIN9_SETTLING_US (AIN#(0:13)_SETTLING_US@9)

Address: 42018

```
property ain_all_ef_index: int
```

Write 0 to deactivate AIN_EF on all AINs. No other values may be written to this register. Reads will return the AIN_EF index if all 128 AINs are set to the same value. If values are not the same returns 0xFFFF (65535).

Register: AIN_ALL_EF_INDEX

Address: 43906

```
property ain_all_negative_ch: int
```

A write to this global parameter affects all AIN. Writing 1 will set all AINs to differential. Writing 199 will set all AINs to single-ended. A read will return 1 if all AINs are set to differential and 199 if all AINs are set to single-ended. If AIN configurations are not consistent 0xFFFF will be returned.

Register: AIN_ALL_NEGATIVE_CH

Address: 43902

```
property ain_all_range: float
```

A write to this global parameter affects all AIN. A read will return the correct setting if all channels are set the same, but otherwise will return -9999.

Register: AIN_ALL_RANGE

Address: 43900

```
property ain_all_resolution_index: int
```

The resolution index for command-response and AIN-EF readings. A larger resolution index generally results in lower noise and longer sample times. A write to this global parameter affects all AIN. A read will return the correct setting if all channels are set the same, but otherwise will return 0xFFFF.

Register: AIN_ALL_RESOLUTION_INDEX

Address: 43903

```
property ain_all_settling_us: float
```

Settling time for command-response and AIN-EF readings. A write to this global parameter affects all AIN. A read will return the correct setting if all channels are set the same, but otherwise will return -9999. Max is 50,000 us.

Register: AIN_ALL_SETTLING_US

Address: 43904

```
property asynch_baud: int
```

The symbol rate that will be used for communication. 9600 is typical. Up to 38400 works, but heavily loads the T7's processor.

Register: ASYNCH_BAUD

Address: 5420

```
property asynch_data_rx: int
```

Read received data from here.

This register is a buffer. Underrun behavior - fill with zeros.

Register: ASYNCH_DATA_RX

Address: 5495

```
property asynch_data_tx: int
```

Write data to be transmitted here. This register is a buffer.

Register: ASYNCH_DATA_TX

Address: 5490

```
property asynch_enable: int
```

1 = Turn on Asynch. Configures timing hardware, DIO lines and allocates the receiving buffer.

Register: ASYNCH_ENABLE

Address: 5400

```
property asynch_num_bytes_rx: int
```

The number of data bytes that have been received.

Register: ASYNCH_NUM_BYTES_RX

Address: 5435

```
property asynch_num_bytes_tx: int
```

The number of bytes to be transmitted after writing to GO. Max is 256.

Register: ASYNCH_NUM_BYTES_TX

Address: 5440

```
property asynch_num_data_bits: int
```

The number of data bits per frame. 0-8, 0=8.

Register: ASYNCH_NUM_DATA_BITS

Address: 5415

```
property asynch_num_parity_errors: int
```

The number of parity errors that have been detected. Cleared when UART is enabled. Can also be cleared by writing 0.

Register: ASYNCH_NUM_PARITY_ERRORS

Address: 5465

```
property asynch_num_stop_bits: int
```

The number of stop bits. Values: 0 = zero stop bits, 1 = one stop bit, 2 = two stop bits.

Register: ASYNCH_NUM_STOP_BITS

Address: 5455

```
property asynch_parity: int
```

Parity setting: 0=none, 1=odd, 2=even.

Register: ASYNCH_PARITY

Address: 5460

```
property asynch_rx_buffer_size_bytes: int
```

Number of bytes to use for the receiving buffer. Max is 2048. 0 = 200.

Register: ASYNCH_RX_BUFFER_SIZE_BYTES

Address: 5430

```
property asynch_rx_dionum: int
```

The DIO line that will receive data. (RX)

Register: ASYNCH_RX_DIONUM

Address: 5405

```
property asynch_tx_dionum: int
```

The DIO line that will transmit data. (TX)

Register: ASYNCH_TX_DIONUM

Address: 5410

```
property asynch_tx_go: int
```

Write a 1 to this register to initiate a transmission.

Register: ASYNCH_TX_GO

Address: 5450

```
property bootloader_version: float
```

The bootloader version installed on the main processor.

Register: BOOTLOADER_VERSION

Address: 60006

```
property cio0: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: CIO0 (CIO#(0:3)@0)

Address: 2016

```
property cio1: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: CIO1 (CIO#(0:3)@1)

Address: 2017

```
property cio2: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: CIO2 (CIO#(0:3)@2)

Address: 2018

```
property cio3: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: CIO3 (CIO#(0:3)@3)

Address: 2019

```
property cio_direction: int
```

Read or write the direction of the 4 bits of CIO in a single binary-encoded value. 0=Input and 1=Output. The upper 8-bits of this value are inhibits.

Register: CIO_DIRECTION

Address: 2602

```
property cio_mio_state: int
```

Read or write the state of the 12 bits of CIO-MIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written.

Register: CIO_MIO_STATE

Address: 2582

```
property cio_state: int
```

Read or write the state of the 4 bits of CIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written. The upper 8-bits of this value are inhibits.

Register: CIO_STATE

Address: 2502

```
property cleanse: int
```

Writing 0x5317052E to this register will trigger a system cleanse.

Register: CLEANSE

Address: 49090

```
property core_timer: int
```

Internal 32-bit system timer running at 1/2 core speed, thus normally 80M/2 => 40 MHz.

Register: CORE_TIMER

Address: 61520

```
property current_source_10ua_cal_value: float
```

Fixed current source value in Amps for the 10UA terminal. This value is stored during factory calibration, it is not a current reading. Using the equation V=IR, with a known current and voltage, it is possible to calculate resistance of RTDs.

Register: CURRENT_SOURCE_10UA_CAL_VALUE

Address: 1900

```
property current_source_200ua_cal_value: float
```

Fixed current source value in Amps for the 200UA terminal. This value is stored during factory calibration, it is not a current reading. Using the equation V=IR, with a known current and voltage, it is possible to calculate resistance of RTDs.

Register: CURRENT_SOURCE_200UA_CAL_VALUE

Address: 1902

```
property dac0: float
```

Pass a voltage for the specified analog output.

Register: DAC0 (DAC#(0:1)@0)

Address: 1000

```
property dac0_binary: int
```

Writes binary values to the DACs. Binary values are 16-bit. If the DAC's resolution is less than 16 then the lower bits are ignored. 0 = lowest output, 65535 = highest output.

Register: DAC0_BINARY (DAC#(0:1)_BINARY@0)

Address: 51000

```
property dac1: float
```

Pass a voltage for the specified analog output.

Register: DAC1 (DAC#(0:1)@1)

Address: 1002

```
property dac1_binary: int
```

Writes binary values to the DACs. Binary values are 16-bit. If the DAC's resolution is less than 16 then the lower bits are ignored. 0 = lowest output, 65535 = highest output.

Register: DAC1_BINARY (DAC#(0:1)_BINARY@1)

Address: 51002

```
property dac1_frequency_out_enable: int
```

0 = off, 1 = output 10 Hz signal on DAC1. The signal will be a square wave with peaks of 0 and 3.3V. Note that writing to DAC1 or enabling a stream out which is targeting DAC1 will disable this feature.

Register: DAC1_FREQUENCY_OUT_ENABLE

Address: 61532

```
property device_name_default: str
```

Reads return the current device name. Writes update the default and current device name. A reboot is necessary to update the name reported by NBNS. Up to 49 characters, cannot contain periods.

Register: DEVICE_NAME_DEFAULT

Address: 60500

```
property device_reset_dbg_reg: int
```

Bitmask register that indicates why a device was last re-set. bit0: Power-on reset, bit1: Brown-out, bit2: Wake from idle, bit3: Wake from sleep, bit4: watchdog timer time-out, bit5: reserved, bit6: Software reset, bit7: external reset (MCLR), bit8: Voltage regulator standby, bit9: Configuration mismatch.

Register: DEVICE_RESET_DBG_REG

Address: 60014

```
property dio0_ef_config_a: int
```

Function dependent on selected feature index.

Register: DIO0_EF_CONFIG_A (DIO#(0:22)_EF_CONFIG_A@0)

```

The clock will count to this value and then start over at zero. The clock pulses counted are those after the divisor. 0 results in the max roll value possible. This is a 32-bit value (0-4294967295) if using a 32-bit clock, and a 16-bit value (0-65535) if using a 16-bit clock.

Register: DIO_EF_CLOCK2_ROLL_VALUE

Address: 44924

```
property dio_inhibit: int
```

A single binary-encoded value where each bit determines whether _STATE, _DIRECTION or _ANALOG_ENABLE writes affect that bit of digital I/O. 0=Default=Affected, 1=Ignored.

Register: DIO_INHIBIT

Address: 2900

```
property dio_state: int
```

Read or write the state of all digital I/O in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. A read of an output returns the current logic level on the terminal, not necessarily the output state written. Writes are filtered by the value in DIO_INHIBIT.

Register: DIO_STATE

Address: 2800

```
property eio0: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO0 (EIO#(0:7)@0)

Address: 2008

```
property eio1: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO1 (EIO#(0:7)@1)

Address: 2009

```
property eio2: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO2 (EIO#(0:7)@2)

Address: 2010

```
property eio3: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO3 (EIO#(0:7)@3)

Address: 2011

```
property eio4: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO4 (EIO#(0:7)@4)

Address: 2012

```
property eio5: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO5 (EIO#(0:7)@5)

Address: 2013

```
property eio6: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO6 (EIO#(0:7)@6)

Address: 2014

```
property eio7: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO7 (EIO#(0:7)@7)

Address: 2015

```
property eio_cio_state: int
```

Read or write the state of the 12 bits of EIO-CIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written. As of firmware 1.0172, MIO states are included in the upper nibble of the CIO byte.

Register: EIO_CIO_STATE

Address: 2581

```
property eio_direction: int
```

Read or write the direction of the 8 bits of EIO in a single binary-encoded value. 0=Input and 1=Output. The upper 8-bits of this value are inhibits.

Register: EIO_DIRECTION

Address: 2601

```
property eio_state: int
```

Read or write the state of the 8 bits of EIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written. The upper 8-bits of this value are inhibits.

Register: EIO_STATE

Address: 2501

```
property ethernet_altdns: str
```

Read the current Alt DNS of wired Ethernet.

Register: ETHERNET_ALTDNS

Address: 49108

```
property ethernet_altdns_default: str
```

The Alt DNS of wired Ethernet after a power-cycle to the device.

Register: ETHERNET_ALTDNS_DEFAULT

Address: 49158

```
property ethernet_apply_settings: int
```

Writing 1 to this register power-cycles Ethernet. It tells the device to waits 1s before turning off Ethernet and then 500ms before turning it back on.

Register: ETHERNET_APPLY_SETTINGS

Address: 49190

```
property ethernet_dhcp_enable: int
```

Read the current Enabled/Disabled state of Ethernet DHCP.

Register: ETHERNET_DHCP_ENABLE

Address: 49110

```
property ethernet_dhcp_enable_default: int
```

The Enabled/Disabled state of Ethernet DHCP after a power-cycle to the device.

Register: ETHERNET_DHCP_ENABLE_DEFAULT

Address: 49160

```
property ethernet_dns: str
```

Read the current DNS of wired Ethernet.

Register: ETHERNET_DNS

Address: 49106

```
property ethernet_dns_default: str
```

The DNS of wired Ethernet after a power-cycle to the device.

Register: ETHERNET_DNS_DEFAULT

Address: 49156

```
property ethernet_gateway: str
```

Read the current gateway of wired Ethernet.

Register: ETHERNET_GATEWAY

Address: 49104

```
property ethernet_gateway_default: str
```

The gateway of wired Ethernet after a power-cycle to the device.

Register: ETHERNET_GATEWAY_DEFAULT

Address: 49154

```
property ethernet_ip: str
```

Read the current IP address of wired Ethernet.

Register: ETHERNET_IP

Address: 49100

```
property ethernet_ip_default: str
```

The IP address of wired Ethernet after a power-cycle to the device.

Register: ETHERNET_IP_DEFAULT

Address: 49150

```
property ethernet_mac: str
```

The MAC address of the wired Ethernet module.

Register: ETHERNET_MAC

Address: 60020

```
property ethernet_subnet: str
```

Read the current subnet of wired Ethernet.

Register: ETHERNET_SUBNET

Address: 49102

```
property ethernet_subnet_default: str
```

The subnet of wired Ethernet after a power-cycle to the device.

Register: ETHERNET_SUBNET_DEFAULT

Address: 49152

```
property ethernet_udp_discovery_only: int
```

Restricts which Modbus operations are allowed over UDP. When set to 1, only the registers needed for discovering units can be read and any other operation will throw an error.

Register: ETHERNET_UDP_DISCOVERY_ONLY

Address: 49115

```
property ethernet_udp_discovery_only_default: int
```

The Enabled/Disabled state of ETHERNET_UDP_DISCOVERY_ONLY after a power-cycle to the device.

Register: ETHERNET_UDP_DISCOVERY_ONLY_DEFAULT

Address: 49165

```
property file_io_attributes: int
```

Used to differentiate files from directories/folders. Bitmask: Bit0: Reserved, Bit1: Reserved, Bit2: Reserved, Bit3: Reserved, Bit4: 1=Directory, Bit5: 1=File.

Register: FILE_IO_ATTRIBUTES

Address: 60623

```
property file_io_close: int
```

Write any value to this register to close the open file.

Register: FILE_IO_CLOSE

Address: 60621

```
property file_io_delete: int
```

Write any value to this register to delete the active file. Must first designate which file to delete by writing to FILE_IO_PATH_WRITE_LEN_BYTES then FILE_IO_PATH_WRITE.

Register: FILE_IO_DELETE

Address: 60622

```
property file_io_dir_change: int
```

Write any value to this register to change the current working directory (CWD). Must first designate which directory to open by writing to FILE_IO_PATH_WRITE_LEN_BYTES then FILE_IO_PATH_WRITE.

Register: FILE_IO_DIR_CHANGE

Address: 60600

```
property file_io_dir_current: int
```

Write any value to this register to load the current working directory into FILE_IO_PATH_READ, and its length into FILE_IO_PATH_READ_LEN_BYTES. Can be used to identify current position in a file tree.

Register: FILE_IO_DIR_CURRENT

Address: 60601

```
property file_io_dir_first: int
```

Write any value to this register to initiate iteration through files and directories in the CWD. Typical sequence: FILE_IO_DIR_FIRST(W), then loop through: [FILE_IO_NAME_READ_LEN(R), FILE_IO_NAME_READ(R), FILE_IO_ATTRIBUTES(R), FILE_IO_SIZE_BYTES(R), FILE_IO_DIR_NEXT(W)] ..until any of the following errors: FILE_IO_END_OF_CWD (2966), FILE_IO_INVALID_OBJECT (2809), or FILE_IO_NOT_FOUND (2960).

Register: FILE_IO_DIR_FIRST

Address: 60610

```
property file_io_dir_make: int
```

Unimplemented.

Register: FILE_IO_DIR_MAKE

Address: 60602

```
property file_io_dir_next: int
```

Write any value to this register to continue iteration through files and directories in the CWD.

Register: FILE_IO_DIR_NEXT

Address: 60611

```
property file_io_dir_remove: int
```

Unimplemented.

Register: FILE_IO_DIR_REMOVE

Address: 60603

```
property file_io_disk_format_index: int
```

Used to determine the format of the SD card. 0=None or Unknown, 1=FAT12, 2=FAT16(Windows FAT), 3=FAT32.

Register: FILE_IO_DISK_FORMAT_INDEX

Address: 60638

```
property file_io_disk_free_clusters: int
```

Free (available) clusters in the SD card. Used to determine free space. Captured on read of FILE_IO_DISK_SECTOR_SIZE_BYTES.

Register: FILE_IO_DISK_FREE_CLUSTERS

Address: 60636

```
property file_io_disk_sector_size_bytes: int
```

The size of each sector in the SD card in bytes. In Windows this is called the Allocation Size.

Register: FILE_IO_DISK_SECTOR_SIZE_BYTES

Address: 60630

```
property file_io_disk_sectors_per_cluster: int
```

The number of sectors in each cluster. Captured on read of FILE_IO_DISK_SECTOR_SIZE_BYTES.

Register: FILE_IO_DISK_SECTORS_PER_CLUSTER

Address: 60632

```
property file_io_disk_total_clusters: int
```

The total number of clusters in the SD card. Captured on read of FILE_IO_DISK_SECTOR_SIZE_BYTES.

Register: FILE_IO_DISK_TOTAL_CLUSTERS

Address: 60634

```
property file_io_open: int
```

Write any value to this register to open a file. Must first designate which file to open by writing to FILE_IO_PATH_WRITE_LEN_BYTES then FILE_IO_PATH_WRITE.

Register: FILE_IO_OPEN

Address: 60620

```
property file_io_path_read: int
```

Read the next file path in the CWD. Length of the string (in bytes) determined by FILE_IO_PATH_READ_LEN_BYTES. File paths will be null terminated.

This register is a buffer. Underrun behavior - fill with zeros.

Register: FILE_IO_PATH_READ

Address: 60652

```
property file_io_path_read_len_bytes: int
```

Read the length (in bytes) of the next file path or directory to access.

Register: FILE_IO_PATH_READ_LEN_BYTES

Address: 60642

```
property file_io_path_write: int
```

Write the desired file path. Must first write the length of the file path string (in bytes) to FILE_IO_PATH_WRITE_LEN_BYTES. File paths should be null terminated. This register is a buffer.

Register: FILE_IO_PATH_WRITE

Address: 60650

```
property file_io_path_write_len_bytes: int
```

Write the length (in bytes) of the file path or directory to access.

Register: FILE_IO_PATH_WRITE_LEN_BYTES

Address: 60640

```
property file_io_read: int
```

Read the contents of a file. Must first write to FILE_IO_OPEN. Size of the file (in bytes) determined by FILE_IO_SIZE_BYTES.

This register is a buffer. Underrun behavior - throws an error.

Register: FILE_IO_READ

Address: 60656

```
property file_io_size_bytes: int
```

The size of the file in bytes. Directories have 0 size.

Register: FILE_IO_SIZE_BYTES

Address: 60628

```
property file_io_write: int
```

Unimplemented. This register is a buffer.

Register: FILE_IO_WRITE

Address: 60654

```
property fio0: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO0 (FIO#(0:7)@0)

Address: 2000

```
property fio1: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO1 (FIO#(0:7)@1)

Address: 2001

```
property fio2: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO2 (FIO#(0:7)@2)

Address: 2002

```
property fio3: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO3 (FIO#(0:7)@3)

Address: 2003

```
property fio4: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO4 (FIO#(0:7)@4)

Address: 2004

```
property fio5: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO5 (FIO#(0:7)@5)

Address: 2005

```
property fio6: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO6 (FIO#(0:7)@6)

Address: 2006

```
property fio7: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO7 (FIO#(0:7)@7)

Address: 2007

```
property fio_direction: int
```

Read or write the direction of the 8 bits of FIO in a single binary-encoded value. 0=Input and 1=Output. The upper 8-bits of this value are inhibits.

Register: FIO_DIRECTION

Address: 2600

```
property fio_eio_state: int
```

Read or write the state of the 16 bits of FIO-EIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written.

Register: FIO_EIO_STATE

Address: 2580

```
property fio_state: int
```

Read or write the state of the 8 bits of FIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written. The upper 8-bits of this value are inhibits.

Register: FIO_STATE

Address: 2500

```
property firmware_version: float
```

The current firmware version installed on the main processor.

Register: FIRMWARE_VERSION

Address: 60004

```
property hardware_installed: int
```

Bitmask indicating installed hardware options. bit0: High Resolution ADC, bit1: WiFi, bit2: RTC, bit3: microSD.

Register: HARDWARE_INSTALLED

Address: 60010

```
property hardware_version: float
```

The hardware version of the device.

Register: HARDWARE_VERSION

Address: 60002

```
property i2c_acks: int
```

A binary encoded value (array of bits) used to observe ACKs from the slave device.

Register: I2C_ACKS

Address: 5114

```
property i2c_data_rx: int
```

Data that has been read from the I2C bus.

This register is a buffer. Underrun behavior - fill with zeros.

Register: I2C_DATA_RX

Address: 5160

```
property i2c_data_tx: int
```

Data that will be written to the I2C bus. This register is a buffer.

Register: I2C_DATA_TX

Address: 5120

```
property i2c_go: int
```

Writing to this register will instruct the LabJack to perform an I2C transaction.

Register: I2C_GO

Address: 5110

```
property i2c_num_bytes_rx: int
```

The number of data bytes to read. Zero is valid and will result in a write-only I2C operation.

Register: I2C_NUM_BYTES_RX

Address: 5109

```
property i2c_num_bytes_tx: int
```

The number of data bytes to transmit. Zero is valid and will result in a read-only I2C operation.

Register: I2C_NUM_BYTES_TX

Address: 5108

```
property i2c_options: int
```

Advanced. Controls details of the I2C protocol to improve device compatibility. bit 0: 1 = Reset the I2C bus before attempting communication. bit 1: 0 = Restarts will use a stop and a start, 1 = Restarts will not use a stop. bit 2: 1 = disable clock stretching.

Register: I2C_OPTIONS

Address: 5103

```
property i2c_scl_dionum: int
```

The number of the DIO line to be used as the I2C clock line. Ex: Writing 1 will force FIO1 to become the I2C-SCL line.

Register: I2C_SCL_DIONUM

Address: 5101

```
property i2c_sda_dionum: int
```

The number of the DIO line to be used as the I2C data line. Ex: Writing 0 will force FIO0 to become the I2C-SDA line.

Register: I2C_SDA_DIONUM

Address: 5100

```
property i2c_slave_address: int
```

The 7-bit address of the slave device. Value is shifted left by firmware to allow room for the I2C R/W bit.

Register: I2C_SLAVE_ADDRESS

Address: 5104

```
property i2c_speed_throttle: int
```

This value controls the I2C clock frequency. Pass 0-65535. Default=0 corresponds to 65536 internally which results in ~450 kHz. 1 results in ~40 Hz, 65516 is ~100 kHz.

Register: I2C_SPEED_THROTTLE

Address: 5102

```
property internal_flash_calculate_crc: int
```

Calculates the checksum of a 4096 byte flash page.

Register: INTERNAL_FLASH_CALCULATE_CRC

Address: 61842

```
property internal_flash_erase: int
```

Erases a 4k section of internal flash starting at the specified address. This register is a buffer.

Register: INTERNAL_FLASH_ERASE

Address: 61820

```
property internal_flash_key: int
```

Sets the region of internal flash to which access is allowed.

Register: INTERNAL_FLASH_KEY

Address: 61800

```
property internal_flash_read: int
```

Data read from internal flash. Read size must be an even number of registers.

Register: INTERNAL_FLASH_READ

Address: 61812

```
property internal_flash_read_pointer: int
```

The address in internal flash that reads will start from.

Register: INTERNAL_FLASH_READ_POINTER

Address: 61810

```
property internal_flash_write: int
```

Data written here will be written to internal flash. Write size must be an even number of registers. This register is a buffer.

Register: INTERNAL_FLASH_WRITE

Address: 61832

```
property internal_flash_write_pointer: int
```

Address in internal flash where writes will begin.

Register: INTERNAL_FLASH_WRITE_POINTER

Address: 61830

```
property io_config_check_for_default: int
```

Returns 1 if the current configuration matches the default configuration.

Register: IO_CONFIG_CHECK_FOR_DEFAULT

Address: 49018

```
property io_config_check_for_factory: int
```

Returns 1 if default settings are the same as factory settings.

Register: IO_CONFIG_CHECK_FOR_FACTORY

Address: 49000

```
property io_config_current_crc32: int
```

Collects the current IO configuration and calculates of a CRC32.

Register: IO_CONFIG_CURRENT_CRC32

Address: 49020

```
property io_config_current_pread: int
```

The address in the current configuration data which reads will start from.

Register: IO_CONFIG_CURRENT_pREAD

Address: 49014

```
property io_config_current_read: int
```

Data read from the current configuration.

Register: IO_CONFIG_CURRENT_READ

Address: 49016

```
property io_config_default_pread: int
```

The address in the configuration data which reads will start from.

Register: IO_CONFIG_DEFAULT_pREAD

Address: 49010

```
property io_config_default_read: int
```

Data read from the startup configuration.

Register: IO_CONFIG_DEFAULT_READ

Address: 49012

```
property io_config_factory_pread: int
```

The address in the factory configuration data which reads will start from.

Register: IO_CONFIG_FACTORY_pREAD

Address: 49006

```
property io_config_factory_read: int
```

Data read from factory configuration.

Register: IO_CONFIG_FACTORY_READ

Address: 49008

```
property io_config_set_current_to_default: int
```

Write a 1 to set current values to default configuration. The default values are retrieved from flash and written to the current configuration registers, thus this behaves similar to reboot/power-up. Systems affected: AIN, DIO, DAC, AIN_EF, DIO_EF.

Register: IO_CONFIG_SET_CURRENT_TO_DEFAULT

Address: 61991

```
property io_config_set_current_to_factory: int
```

Write a 1 to set current values to factory configuration. The factory values are retrieved from flash and written to the current configuration registers. Systems affected: AIN, DIO, DAC, AIN_EF, DIO_EF.

Register: IO_CONFIG_SET_CURRENT_TO_FACTORY

Address: 61990

```
property io_config_set_default_to_current: int
```

Write a 1 to cause new default (reboot/power-up) values to be saved to flash. Current values are retrieved and saved as the new defaults. Systems affected: AIN, DIO, DAC, AIN_EF, DIO_EF.

Register: IO_CONFIG_SET_DEFAULT_TO_CURRENT

Address: 49002

```
property io_config_set_default_to_factory: int
```

Write a 1 to cause new default (reboot/power-up) values to be saved to flash. Factory values are retrieved and saved as the new defaults. Systems affected: AIN, DIO, DAC, AIN_EF, DIO_EF.

Register: IO_CONFIG_SET_DEFAULT_TO_FACTORY

Address: 49004

```
property last_err_detail: int
```

Returns the last LabJack error code seen on the device.

Register: LAST_ERR_DETAIL

Address: 55000

```
property last_err_frame: int
```

Returns the frame number that caused the last error.

Register: LAST_ERR_FRAME

Address: 55002

```
property last_err_transaction_id: int
```

Returns the transaction ID of the Modbus TCP packet that caused the last error.

Register: LAST_ERR_TRANSACTION_ID

Address: 55003

```
property last_mb_err: int
```

Returns the last Modbus TCP error code seen on the device.

Register: LAST_MB_ERR

Address: 55001

```
property led_comm: int
```

Sets the state of the COMM LED when the LEDs are set to manual, see the POWER_LED register.

Register: LED_COMM

Address: 2990

```
property led_status: int
```

Sets the state of the STATUS LED when the LEDs are set to manual, see the POWER_LED register.

Register: LED_STATUS

Address: 2991

```
property lua_debug_data: int
```

Read debug data from here. This register is a buffer.

Register: LUA_DEBUG_DATA

Address: 6024

```
property lua_debug_enable: int
```

Write 1 to this register to enable debugging.

Register: LUA_DEBUG_ENABLE

Address: 6020

```
property lua_debug_enable_default: int
```

This is the value that will be loaded into LUA_DEBUG_ENABLE when the LabJack boots up.

Register: LUA_DEBUG_ENABLE_DEFAULT

Address: 6120

```
property lua_debug_num_bytes: int
```

The number of data bytes in the debug buffer waiting to be read.

Register: LUA_DEBUG_NUM_BYTES

Address: 6022

```
property lua_debug_num_bytes_default: int
```

This is the number of bytes that will be used for the lua debug buffer.

Register: LUA_DEBUG_NUM_BYTES_DEFAULT

Address: 6122

```
property lua_load_saved: int
```

Writing any value reads the script from Flash and loads it into RAM. The script can now be compiled and run.

Register: LUA_LOAD_SAVED

Address: 6034

```
property lua_no_warn_truncation: int
```

Writing a 1 to this register will prevent truncation warnings from being displayed. This register will be cleared every time Lua is started.

Register: LUA_NO_WARN_TRUNCATION

Address: 6050

```
property lua_run: int
```

Writing 1 compiles and runs the Lua script that is loaded in RAM. Writing zero stops the script and begins cleaning up memory. Users may poll the register after writing a value of 0 to verify that the VM is unloaded, and garbage collection is complete. 0 = VM fully unloaded. 1 = Running/in-progress.

Register: LUA_RUN

Address: 6000

```
property lua_run_default: int
```

If set to 1 the script saved in flash will be loaded and run when the LabJack boots up.

Register: LUA_RUN_DEFAULT

Address: 6100

```
property lua_save_to_flash: int
```

Write 1 to save the loaded source code to flash.

Register: LUA_SAVE_TO_FLASH

Address: 6032

```
property lua_saved_read: int
```

Read script saved to flash from here.

Register: LUA_SAVED_READ

Address: 6038

```
property lua_saved_read_pointer: int
```

Address within the saved Lua script in Flash to begin reading from.

Register: LUA_SAVED_READ_POINTER

Address: 6036

```
property lua_source_size: int
```

Allocates RAM for the source code.

Register: LUA_SOURCE_SIZE

Address: 6012

```
property lua_source_write: int
```

Write the source code here. Source will be saved to the RAM allocated by LUA_SOURCE_SIZE. This register is a buffer.

Register: LUA_SOURCE_WRITE

Address: 6014

```
property mio0: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: MIO0 (MIO#(0:2)@0)

Address: 2020

```
property mio1: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: MIO1 (MIO#(0:2)@1)

Address: 2021

```
property mio2: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: MIO2 (MIO#(0:2)@2)

Address: 2022

```
property mio_direction: int
```

Read or write the direction of the 3 bits of MIO in a single binary-encoded value. 0=Input and 1=Output. The upper 8-bits of this value are inhibits.

Register: MIO_DIRECTION

Address: 2603

```
property mio_state: int
```

Read or write the state of the 3 bits of MIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written. The upper 8-bits of this value are inhibits.

Register: MIO_STATE

Address: 2503

```
property onewire_data_rx: int
```

Data received over the 1-wire bus.

This register is a buffer. Underrun behavior - buffer is static, old data will fill the extra locations, firmware 1.0225 changes this to read zeros.

Register: ONEWIRE_DATA_RX

Address: 5370

```
property onewire_data_tx: int
```

Data to be transmitted over the 1-wire bus. This register is a buffer.

Register: ONEWIRE_DATA_TX

Address: 5340

```
property onewire_dpu_dionum: int
```

The dynamic pullup control DIO number.

Register: ONEWIRE_DPU_DIONUM

Address: 5301

```
property onewire_dq_dionum: int
```

The data-line DIO number.

Register: ONEWIRE_DQ_DIONUM

Address: 5300

```
property onewire_function: int
```

Set the ROM function to use. 0xF0=Search, 0xCC=Skip, 0x55=Match, 0x33=Read.

Register: ONEWIRE_FUNCTION

Address: 5307

```
property onewire_go: int
```

Instructs the device to perform the configured 1-wire transaction.

Register: ONEWIRE_GO

Address: 5310

```
property onewire_num_bytes_rx: int
```

Number of data bytes to be received.

Register: ONEWIRE_NUM_BYTES_RX

Address: 5309

```
property onewire_num_bytes_tx: int
```

Number of data bytes to be sent.

Register: ONEWIRE_NUM_BYTES_TX

Address: 5308

```
property onewire_options: int
```

Controls advanced features. Value is a bitmask. bit 0: reserved, bit 1: reserved, bit 2: 1=DPU Enabled 0=DPU Disabled, bit 3: DPU Polarity 1=Active state is high, 0=Active state is low (Dynamic Pull-Up)

Register: ONEWIRE_OPTIONS

Address: 5302

```
property onewire_path_h: int
```

Upper 32-bits of the path to take during a search.

Register: ONEWIRE_PATH_H

Address: 5324

```
property onewire_path_l: int
```

Lower 32-bits of the path to take during a search.

Register: ONEWIRE_PATH_L

Address: 5326

```
property onewire_rom_branchs_found_h: int
```

Upper 32-bits of the branches detected during a search.

Register: ONEWIRE_ROM_BRANCHS_FOUND_H

Address: 5332

```
property onewire_rom_branchs_found_l: int
```

Lower 32-bits of the branches detected during a search.

Register: ONEWIRE_ROM_BRANCHS_FOUND_L

Address: 5334

```
property onewire_rom_match_h: int
```

Upper 32-bits of the ROM to match.

Register: ONEWIRE_ROM_MATCH_H

Address: 5320

```
property onewire_rom_match_l: int
```

Lower 32-bits of the ROM to match.

Register: ONEWIRE_ROM_MATCH_L

Address: 5322

```
property onewire_search_result_h: int
```

Upper 32-bits of the search result.

Register: ONEWIRE_SEARCH_RESULT_H

Address: 5328

```
property onewire_search_result_l: int
```

Lower 32-bites of the search result.

Register: ONEWIRE_SEARCH_RESULT_L

Address: 5330

```
property power_ain: int
```

The current ON/OFF state of the analog input module.

Register: POWER_AIN

Address: 48005

```
property power_ain_default: int
```

The ON/OFF state of the analog input module after a power-cycle to the device. Provided to optionally reduce power consumption.

Register: POWER_AIN_DEFAULT

Address: 48055

```
property power_core: int
```

The core processor speed. 0=80MHz, 1=20MHz, 2=2MHz, 3=250kHz.

Register: POWER_CORE

Address: 48001

```
property power_core_default: int
```

Controls the core processor speed after a power-cycle to the device. 0=80MHz, 1=20MHz, 2=2MHz, 3=250kHz.

Register: POWER_CORE_DEFAULT

Address: 48051

```
property power_ethernet: int
```

The current ON/OFF state of the Ethernet module.

Register: POWER_ETHERNET

Address: 48003

```
property power_ethernet_default: int
```

The ON/OFF state of the Ethernet module after a power-cycle to the device. Provided to optionally reduce power consumption.

Register: POWER_ETHERNET_DEFAULT

Address: 48053

```
property power_led: int
```

Sets the LED operation: 0 = Off. Useful for lower power applications. 1 = normal. 2 = Lower power, LEDs will still blink but will normally be off. 3 = Reserved. 4 = Manual, in this mode the LEDs can be user controlled.

Register: POWER_LED

Address: 48006

```
property power_led_default: int
```

The ON/OFF state of the LEDs after a power-cycle to the device.

Register: POWER_LED_DEFAULT

Address: 48056

```
property power_mode: int
```

The current power management state.

Register: POWER_MODE

Address: 48000

```
property power_mode_default: int
```

The power management state after a power-cycle to the device.

Register: POWER_MODE_DEFAULT

Address: 48050

```
property power_usb: int
```

The current ON/OFF state of the USB module.

Register: POWER_USB

Address: 48002

```
property power_usb_default: int
```

The current ON/OFF state of the USB module after a power-cycle to the device.

Register: POWER_USB_DEFAULT

Address: 48052

```
property power_wifi: int
```

The current ON/OFF state of the WiFi module.

Register: POWER_WIFI

Address: 48004

```
property power_wifi_default: int
```

The ON/OFF state of the WiFi module after a power-cycle to the device. Provided to optionally reduce power consumption.

Register: POWER_WIFI_DEFAULT

Address: 48054

```
property product_id: float
```

The numeric identifier of the device. Such as 7 for a T7 / T7-Pro.

Register: PRODUCT_ID

Address: 60000

```
property rtc_set_time_s: int
```

Write a new timestamp to the RTC in seconds since Jan, 1970, aka Epoch or Unix timestamp.

Register: RTC_SET_TIME_S

Address: 61504

```
property rtc_set_time_sntp: int
```

Write any value to instruct the T7 to update its clock from a SNTP server. Requires that SNTP_UPDATE_INTERVAL is non-zero.

Register: RTC_SET_TIME_SNTP

Address: 61506

```
property rtc_time_calendar: int
```

Read six consecutive addresses of type UINT16, starting with this address. The result will be in year, month, day, hour, minute, second calendar format. i.e. [2014, 10, 21, 18, 55, 35]

Register: RTC_TIME_CALENDAR

Address: 61510

```
property rtc_time_s: int
```

Read the current time in seconds since Jan, 1970, aka Epoch or Unix time. This value is calculated from the 80 MHz crystal, not the RTC 32 kHz crystal. Non-pro devices do not have a real time clock, so the reported time is either seconds since device startup or the time reported by the network time protocol over Ethernet. Pro devices have a real time clock that will be used to initialize this register at startup, the time can then be updated by NTP.

Register: RTC_TIME_S

Address: 61500

```
property sbus0_background_enable: int
```

Currently unsupported.

Register: SBUS0_BACKGROUND_ENABLE (SBUS#(0:22)_BACKGROUND_ENABLE@0)

Address: 30250

```
property sbus0_clock_dionum: int
```

This is the DIO# that the external sensor's clock line is connected to.

Register: SBUS0_CLOCK_DIONUM (SBUS#(0:22)_CLOCK_DIONUM@0)

Address: 30225

```
property sbus0_data_dionum: int
```

This is the DIO# that the external sensor's data line is connected to.

Register: SBUS0_DATA_DIONUM (SBUS#(0:22)_DATA_DIONUM@0)

Address: 30200

```
property sbus0_rh: float
```

Reads humidity in % from an external SBUS sensor (EI-1050/SHT1x/SHT7x). # is the DIO line for the EI-1050 enable. If # is the same as the value specified for data or clock line, there will be no control of an enable line.

Register: SBUS0_RH (SBUS#(0:22)_RH@0)

Address: 30150

```
property sbus0_temp: float
```

Reads temperature in Kelvin from an SBUS sensor (EI-1050/SHT1x/SHT7x). SBUS# is the DIO line for the EI-1050 enable. If SBUS# is the same as the value specified for data or clock line, there will be no control of an enable line.

Register: SBUS0_TEMP (SBUS#(0:22)_TEMP@0)

Address: 30100

```
property sbus10_background_enable: int
```

Currently unsupported.

Register: SBUS10_BACKGROUND_ENABLE (SBUS#(0:22)_BACKGROUND_ENABLE@10)

Address: 30260

```
property sbus10_clock_dionum: int
```

This is the DIO# that the external sensor's clock line is connected to.

Register: SBUS10_CLOCK_DIONUM (SBUS#(0:22)_CLOCK_DIONUM@10)

Address: 30235

```
property sbus10_data_dionum: int
```

This is the DIO# that the external sensor's data line is connected to.

Register: SBUS10_DATA_DIONUM (SBUS#(0:22)_DATA_DIONUM@10)

Address: 30210

```
property sbus10_rh: float
```

Reads humidity in % from an external SBUS sensor (EI-1050/SHT1x/SHT7x). # is the DIO line for the EI-1050 enable. If # is the same as the value specified for data or clock line, there will be no control of an enable line.

Register: SBUS10_RH (SBUS#(0:22)_RH@10)

Address: 30170

```
property sbus10_temp: float
```

Reads temperature in Kelvin from an SBUS sensor (EI-1050/SHT1x/SHT7x). SBUS# is the DIO line for the EI-1050 enable. If SBUS# is the same as the value specified for data or clock line, there will be no control of an enable line.

Register: SBUS10_TEMP (SBUS#(0:22)_TEMP@10)

Address: 30120

Address: 30118

```
property sbus_all_clock_dionum: int
```

A write to this global parameter sets all SBUS clock line registers to the same value. A read will return the correct setting if all channels are set the same, but otherwise will return 0xFF.

Register: SBUS_ALL_CLOCK_DIONUM

Address: 30276

```
property sbus_all_clock_speed: int
```

Sets the clock speed. The clock is software generated so the resulting frequency is not exact. Valid range is 0-65535. Larger values are faster. 0 is the fastest option and is equivalent to 65536. A value of 0 is ~200 kHz. A value of 65000 is ~9.1 kHz.

Register: SBUS_ALL_CLOCK_SPEED

Address: 30278

```
property sbus_all_data_dionum: int
```

A write to this global parameter sets all SBUS data line registers to the same value. A read will return the correct setting if all channels are set the same, but otherwise will return 0xFF.

Register: SBUS_ALL_DATA_DIONUM

Address: 30275

```
property sbus_all_power_dionum: int
```

Sets the power line. This DIO is set to output-high upon any read of SBUS#_TEMP or SBUS#_RH. Default is FIO6 for the T4 and FIO2 for the T7. An FIO line can power up to 4 sensors while an EIO/CIO/MIO line or DAC line can power up to 20 sensors. Set to 9999 to disable. To use multiple power lines, use a DAC line for power, or otherwise control power yourself, set this to 9999 and then control power using writes to normal registers such as FIO5, EIO0, or DAC0.

Register: SBUS_ALL_POWER_DIONUM

Address: 30277

```
property serial_number: int
```

The serial number of the device.

Register: SERIAL_NUMBER

Address: 60028

```
setup_ain0(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN0.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain

- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain1(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN1.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain10(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN10.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain100(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN100.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain101(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN101.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain102(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN102.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain103(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN103.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain104(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN104.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain105(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN105.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain106(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN106.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain107(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN107.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain108(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN108.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain109(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN109.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain11(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN11.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain

- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain110(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN110.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain111(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN111.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain112(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN112.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain113(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN113.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain114(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN114.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain115(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN115.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain116(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN116.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain117(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN117.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain118(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN118.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain119(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN119.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain12(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN12.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain120(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN120.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain121(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN121.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain

- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain122(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN122.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain123(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN123.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain124(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN124.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain125(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN125.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain126(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN126.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain127(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup AIN127.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain13(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN13.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain2(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN2.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain3(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN3.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain4(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN4.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain48(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN48.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain49(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN49.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain5(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN5.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain

- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain50(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN50.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain51(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN51.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain52(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN52.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain53(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN53.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain54(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN54.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain55(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN55.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain56(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN56.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain57(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN57.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain58(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN58.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain59(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN59.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain6(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN6.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain60(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN60.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain61(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN61.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain

- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain62(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN62.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain63(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN63.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain64(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN64.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain65(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN65.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain66(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN66.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain67(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN67.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain68(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN68.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain69(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN69.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain7(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN7.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain70(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN70.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain71(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN71.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain72(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN72.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain73(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN73.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain

- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain74(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN74.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain75(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN75.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain76(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN76.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain77(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN77.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain78(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN78.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain79(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN79.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain8(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN8.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain80(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN80.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain81(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN81.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain82(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN82.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain83(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN83.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain84(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN84.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain85(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN85.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain

- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain86(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN86.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain87(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN87.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain88(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN88.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain89(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN89.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain9(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN9.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain90(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN90.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain91(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN91.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain92(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN92.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain93(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN93.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain94(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN94.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain95(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN95.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain96(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN96.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain97(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN97.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain

- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain98(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN98.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain99(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN99.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain_all(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup all AIN channels.

```
property sntp_update_interval: int
```

Sets the SNTP retry time in seconds. A value of zero will disable SNTP(0=default). Values must be 10 or greater.

Register: SNTP_UPDATE_INTERVAL

Address: 49702

```
property spc_frequency_out_enable_deprecated: int
```

This has been deprecated in favor of DAC1_FREQUENCY_OUT_ENABLE. 0 = off, 1 = output 10 Hz signal on SPC. Note that stream uses SPC for a timing output, so if you use this while streaming you will get a lot more counts.

Register: SPC_FREQUENCY_OUT_ENABLE_DEPRECATED

Address: 61530

```
property spi_clk_dionum: int
```

The DIO line for Clock.

Register: SPI_CLK_DIONUM

Address: 5001

```
property spi_cs_dionum: int
```

The DIO line for Chip-Select.

Register: SPI_CS_DIONUM

Address: 5000

```
property spi_data_rx: int
```

Read data here.

This register is a buffer. Underrun behavior - fill with zeros.

Register: SPI_DATA_RX

Address: 5050

```
property spi_data_tx: int
```

Write data here. This register is a buffer.

Register: SPI_DATA_TX

Address: 5010

```
property spi_go: int
```

Write 1 to begin the configured SPI transaction.

Register: SPI_GO

Address: 5007

```
property spi_miso_dionum: int
```

The DIO line for Master-In-Slave-Out.

Register: SPI_MISO_DIONUM

Address: 5002

```
property spi_mode: int
```

The SPI mode controls the clock idle state and which edge clocks the data. Bit 1 is CPOL and Bit 0 is CPHA, so CPOL/CPHA for different decimal values: 0 = 0/0 = b00, 1 = 0/1 = b01, 2 = 1/0 = b10, 3 = 1/1 = b11. For CPOL and CPHA explanations, see Wikipedia article: https://en.wikipedia.org/wiki/Serial_Peripheral_Interface_Bus.

Register: SPI_MODE

Address: 5004

```
property spi_mosi_dionum: int
```

The DIO line for Master-Out-Slave-In.

Register: SPI_MOSI_DIONUM

Address: 5003

```
property spi_num_bytes: int
```

The number of bytes to transfer. The maximum transfer size is 100 bytes.

Register: SPI_NUM_BYTES

Address: 5009

```
property spi_options: int
```

Bit 0 is Auto-CS-Disable. When bit 0 is 0, CS is enabled. When bit 0 is 1, CS is disabled. Bit 1: 0 = Set DIO directions before starting the SPI operations, 1 = Do not set DIO directions. Bit 2: 0 = Transmit data MSB first, 1 = LSB first. Bits 4-7: This value sets the number of bits that will be transmitted during the last byte of the SPI operation. Default is 8, valid options are 1-8.

Register: SPI_OPTIONS

Address: 5006

```
property spi_speed_throttle: int
```

This value controls the SPI clock frequency. Pass 0-65535. Default=0 corresponds to 65536 internally which results in ~800 kHz. 65500 = ~100 kHz, 65100 = ~10 kHz, 61100 = ~1 kHz, 21000 = ~100 Hz, and 1 = ~67 Hz. Avoid setting too low such that the entire transaction lasts longer than the 250 millisecond timeout of the internal watchdog timer.

Register: SPI_SPEED_THROTTLE

Address: 5005

```
property stream_auto_target: int
```

Controls where data will be sent. Value is a bitmask. bit 0: 1 = Send to Ethernet 702 sockets, bit 1: 1 = Send to USB, bit 4: 1 = Command-Response mode. All other bits are reserved.

Register: STREAM_AUTO_TARGET

Address: 4016

```
property stream_autorecover_disable: int
```

When the stream buffer becomes full the stream will be stopped. Same behavior as if STREAM_ENABLE is set to zero.

Register: STREAM_AUTORECOVER_DISABLE

Address: 4028

```
property stream_buffer_size_bytes: int
```

Size of the stream data buffer in bytes. A value of 0 equates to the default value. Must be a power of 2. Size in samples is STREAM_BUFFER_SIZE_BYTES/2. Size in scans is (STREAM_BUFFER_SIZE_BYTES/2)/STREAM_NUM_ADDRESSES. Changes while stream is running do not affect the currently running stream.

Register: STREAM_BUFFER_SIZE_BYTES

Address: 4012

```
property stream_clock_source: int
```

Controls which clock source will be used to run the main stream clock. 0 = Internal crystal, 2 = External clock source on CIO3. Rising edges will increment a counter and trigger a stream scan after the number of edges specified in STREAM_EXTERNAL_CLOCK_DIVISOR. T7 will expect external stream clock on CIO3. All other values reserved.

Register: STREAM_CLOCK_SOURCE

Address: 4014

```
property stream_data_capture_16: int
```

If a channel produces 32-bits of data the upper 16 will be saved here.

Register: STREAM_DATA_CAPTURE_16

Address: 4899

```
property stream_data_cr: int
```

Address to read stream data from when operating in C-R mode.

Register: STREAM_DATA_CR

Address: 4500

```
property stream_debug_get_self_index: int
```

Returns the index of the channel. The index is the position in the scan list that the channel occupies.

Register: STREAM_DEBUG_GET_SELF_INDEX

Address: 4898

```
property stream_enable: int
```

Write 1 to start stream. Write 0 to stop stream. Reading this register returns 1 when stream is enabled. When using a triggered stream the stream is considered enabled while waiting for the trigger.

Register: STREAM_ENABLE

Address: 4990

```
property stream_external_clock_divisor: int
```

The number of pulses per stream scan when using an external clock.

Register: STREAM_EXTERNAL_CLOCK_DIVISOR

Address: 4022

```
property stream_num_addresses: int
```

The number of entries in the scanlist.

Register: STREAM_NUM_ADDRESSES

Address: 4004

```
property stream_num_scans: int
```

The number of scans to run before automatically stopping (stream-burst). 0 = run continuously. Limit for STREAM_NUM_SCANS is 2^32-1, but if the host is not reading data as fast as it is acquired you also need to consider STREAM_BUFFER_SIZE_BYTES.

Register: STREAM_NUM_SCANS

Address: 4020

```
property stream_out0: int
```

127) to trigger stream-out updates. When added to the scan list these do count against the max scan rate just like normal input addresses, but they do not return any data in the stream read.

Register: STREAM_OUT0 (STREAM_OUT#(0:3)@0)

Address: 4800

Type:
Include one or more of these registers in STREAM_SCANLIST_ADDRESS#(0

```
property stream_out0_buffer_allocate_num_bytes: int
```

Size of the buffer in bytes as a power of 2. Should be at least twice the size of updates that will be written and no less than 32. The usable buffer size will be equal to the value of this register minus 2 bytes (one 16-bit sample). Before writing data to _BUFFER_###, you must write to _BUFFER_ALLOCATE_NUM_BYTES to allocate RAM for the data. Max is 16384.

Register: STREAM_OUT0_BUFFER_ALLOCATE_NUM_BYTES
(STREAM_OUT#(0:3)_BUFFER_ALLOCATE_NUM_BYTES@0)

Address: 4050

```
property stream_out0_buffer_f32: float
```

Data destination when sending floating point data. Appropriate cal constants are used to convert F32 values to 16-bit binary data, and thus each of these values uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT0_BUFFER_F32 (STREAM_OUT#(0:3)_BUFFER_F32@0)

Address: 4400

```
property stream_out0_buffer_status: int
```

The number of values in the buffer that are not currently being used.

Register: STREAM_OUT0_BUFFER_STATUS (STREAM_OUT#(0:3)_BUFFER_STATUS@0)

Address: 4080

```
property stream_out0_buffer_u16: int
```

Data destination when sending 16-bit integer data. Each value uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT0_BUFFER_U16 (STREAM_OUT#(0:3)_BUFFER_U16@0)

Address: 4420

```
property stream_out0_buffer_u32: int
```

Not used at this time. There are no U32 registers supported in stream-out. This register is a buffer.

Register: STREAM_OUT0_BUFFER_U32 (STREAM_OUT#(0:3)_BUFFER_U32@0)

Address: 4410

```
property stream_out0_enable: int
```

When STREAM_OUT#_ENABLE is enabled, the stream out target is generally updated by one value from the stream out buffer per stream scan. For example, there will generally be one instance of e.g. STREAM_OUT0 in the stream scan list, which will cause one STREAM_OUT0_BUFFER value to be consumed and written to STREAM_OUT0_TARGET for every stream scan. The stream scan list could also contain two instances of STREAM_OUT0, in which case two values from STREAM_OUT0_BUFFER value would be consumed and written for every stream scan.

Register: STREAM_OUT0_ENABLE (STREAM_OUT#(0:3)_ENABLE@0)

Address: 4090

```
property stream_out0_loop_num_values: int
```

The number of values, from the end of the array, that will be repeated after reaching the end of supplied data array.

Register: STREAM_OUT0_LOOP_NUM_VALUES (STREAM_OUT#(0:3)_LOOP_NUM_VALUES@0)

Address: 4060

```
property stream_out0_set_loop: int
```

Controls when new data and loop size are used. 1=Use new data immediately. 2=Wait for synch. New data will not be used until a different stream-out channel is set to Synch. 3=Synch. This stream-out# as well as any stream-outs set to synch will start using new data immediately.

Register: STREAM_OUT0_SET_LOOP (STREAM_OUT#(0:3)_SET_LOOP@0)

Address: 4070

```
property stream_out0_target: int
```

Channel that data will be written to. Before writing data to _BUFFER_###, you must write to _TARGET so the device knows how to interpret and store values.

Register: STREAM_OUT0_TARGET (STREAM_OUT#(0:3)_TARGET@0)

Address: 4040

```
property stream_out1: int
```

127) to trigger stream-out updates. When added to the scan list these do count against the max scan rate just like normal input addresses, but they do not return any data in the stream read.

Register: STREAM_OUT1 (STREAM_OUT#(0:3)@1)

Address: 4801

Type:
Include one or more of these registers in STREAM_SCANLIST_ADDRESS#(0

```
property stream_out1_buffer_allocate_num_bytes: int
```

Size of the buffer in bytes as a power of 2. Should be at least twice the size of updates that will be written and no less than 32. The usable buffer size will be equal to the value of this register minus 2 bytes (one 16-bit sample). Before writing data to _BUFFER_###, you must write to _BUFFER_ALLOCATE_NUM_BYTES to allocate RAM for the data. Max is 16384.

Register: STREAM_OUT1_BUFFER_ALLOCATE_NUM_BYTES (STREAM_OUT#(0:3)_BUFFER_ALLOCATE_NUM_BYTES@1)

Address: 4052

```
property stream_out1_buffer_f32: float
```

Data destination when sending floating point data. Appropriate cal constants are used to convert F32 values to 16-bit binary data, and thus each of these values uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT1_BUFFER_F32 (STREAM_OUT#(0:3)_BUFFER_F32@1)

Address: 4402

```
property stream_out1_buffer_status: int
```

The number of values in the buffer that are not currently being used.

Register: STREAM_OUT1_BUFFER_STATUS (STREAM_OUT#(0:3)_BUFFER_STATUS@1)

Address: 4082

```
property stream_out1_buffer_u16: int
```

Data destination when sending 16-bit integer data. Each value uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT1_BUFFER_U16 (STREAM_OUT#(0:3)_BUFFER_U16@1)

Address: 4421

```
property stream_out1_buffer_u32: int
```

Not used at this time. There are no U32 registers supported in stream-out. This register is a buffer.

Register: STREAM_OUT1_BUFFER_U32 (STREAM_OUT#(0:3)_BUFFER_U32@1)

Address: 4412

```
property stream_out1_enable: int
```

When STREAM_OUT#_ENABLE is enabled, the stream out target is generally updated by one value from the stream out buffer per stream scan. For example, there will generally be one instance of e.g. STREAM_OUT0 in the stream scan list, which will cause one

STREAM_OUT0_BUFFER value to be consumed and written to STREAM_OUT0_TARGET for every stream scan. The stream scan list could also contain two instances of STREAM_OUT0, in which case two values from STREAM_OUT0_BUFFER value would be consumed and written for every stream scan.

Register: STREAM_OUT1_ENABLE (STREAM_OUT#(0:3)_ENABLE@1)

Address: 4092

```
property stream_out1_loop_num_values: int
```

The number of values, from the end of the array, that will be repeated after reaching the end of supplied data array.

Register: STREAM_OUT1_LOOP_NUM_VALUES (STREAM_OUT#(0:3)_LOOP_NUM_VALUES@1)

Address: 4062

```
property stream_out1_set_loop: int
```

Controls when new data and loop size are used. 1=Use new data immediately. 2=Wait for synch. New data will not be used until a different stream-out channel is set to Synch. 3=Synch. This stream-out# as well as any stream-outs set to synch will start using new data immediately.

Register: STREAM_OUT1_SET_LOOP (STREAM_OUT#(0:3)_SET_LOOP@1)

Address: 4072

```
property stream_out1_target: int
```

Channel that data will be written to. Before writing data to _BUFFER_###, you must write to _TARGET so the device knows how to interpret and store values.

Register: STREAM_OUT1_TARGET (STREAM_OUT#(0:3)_TARGET@1)

Address: 4042

```
property stream_out2: int
```

127) to trigger stream-out updates. When added to the scan list these do count against the max scan rate just like normal input addresses, but they do not return any data in the stream read.

Register: STREAM_OUT2 (STREAM_OUT#(0:3)@2)

Address: 4802

Type:
Include one or more of these registers in STREAM_SCANLIST_ADDRESS#(0

```
property stream_out2_buffer_allocate_num_bytes: int
```

Size of the buffer in bytes as a power of 2. Should be at least twice the size of updates that will be written and no less than 32. The usable buffer size will be equal to the value of this register minus 2 bytes (one 16-bit sample). Before writing data to _BUFFER_###, you must write to _BUFFER_ALLOCATE_NUM_BYTES to allocate RAM for the data. Max is 16384.

Register: STREAM_OUT2_BUFFER_ALLOCATE_NUM_BYTES (STREAM_OUT#(0:3)_BUFFER_ALLOCATE_NUM_BYTES@2)

Address: 4054

```
property stream_out2_buffer_f32: float
```

Data destination when sending floating point data. Appropriate cal constants are used to convert F32 values to 16-bit binary data, and thus each of these values uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT2_BUFFER_F32 (STREAM_OUT#(0:3)_BUFFER_F32@2)

Address: 4404

```
property stream_out2_buffer_status: int
```

The number of values in the buffer that are not currently being used.

Register: STREAM_OUT2_BUFFER_STATUS (STREAM_OUT#(0:3)_BUFFER_STATUS@2)

Address: 4084

```
property stream_out2_buffer_u16: int
```

Data destination when sending 16-bit integer data. Each value uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT2_BUFFER_U16 (STREAM_OUT#(0:3)_BUFFER_U16@2)

Address: 4422

```
property stream_out2_buffer_u32: int
```

Not used at this time. There are no U32 registers supported in stream-out. This register is a buffer.

Register: STREAM_OUT2_BUFFER_U32 (STREAM_OUT#(0:3)_BUFFER_U32@2)

Address: 4414

```
property stream_out2_enable: int
```

When STREAM_OUT#_ENABLE is enabled, the stream out target is generally updated by one value from the stream out buffer per stream scan. For example, there will generally be one instance of e.g. STREAM_OUT0 in the stream scan list, which will cause one STREAM_OUT0_BUFFER value to be consumed and written to STREAM_OUT0_TARGET for every stream scan. The stream scan list could also contain two instances of STREAM_OUT0, in which case two values from STREAM_OUT0_BUFFER value would be consumed and written for every stream scan.

Register: STREAM_OUT2_ENABLE (STREAM_OUT#(0:3)_ENABLE@2)

Address: 4094

```
property stream_out2_loop_num_values: int
```

The number of values, from the end of the array, that will be repeated after reaching the end of supplied data array.

Register: STREAM_OUT2_LOOP_NUM_VALUES (STREAM_OUT#(0:3)_LOOP_NUM_VALUES@2)

Address: 4064

```
property stream_out2_set_loop: int
```

Controls when new data and loop size are used. 1=Use new data immediately. 2=Wait for synch. New data will not be used until a different stream-out channel is set to Synch. 3=Synch. This stream-out# as well as any stream-outs set to synch will start using new data immediately.

property stream_out3_buffer_u32: int
```

Not used at this time. There are no U32 registers supported in stream-out. This register is a buffer.

Register: STREAM_OUT3_BUFFER_U32 (STREAM_OUT#(0:3)_BUFFER_U32@3)

Address: 4416

```
property stream_out3_enable: int
```

When STREAM_OUT#_ENABLE is enabled, the stream out target is generally updated by one value from the stream out buffer per stream scan. For example, there will generally be one instance of e.g. STREAM_OUT0 in the stream scan list, which will cause one STREAM_OUT0_BUFFER value to be consumed and written to STREAM_OUT0_TARGET for every stream scan. The stream scan list could also contain two instances of STREAM_OUT0, in which case two values from STREAM_OUT0_BUFFER value would be consumed and written for every stream scan.

Register: STREAM_OUT3_ENABLE (STREAM_OUT#(0:3)_ENABLE@3)

Address: 4096

```
property stream_out3_loop_num_values: int
```

The number of values, from the end of the array, that will be repeated after reaching the end of supplied data array.

Register: STREAM_OUT3_LOOP_NUM_VALUES (STREAM_OUT#(0:3)_LOOP_NUM_VALUES@3)

Address: 4066

```
property stream_out3_set_loop: int
```

Controls when new data and loop size are used. 1=Use new data immediately. 2=Wait for synch. New data will not be used until a different stream-out channel is set to Synch. 3=Synch. This stream-out# as well as any stream-outs set to synch will start using new data immediately.

Register: STREAM_OUT3_SET_LOOP (STREAM_OUT#(0:3)_SET_LOOP@3)

Address: 4076

```
property stream_out3_target: int
```

Channel that data will be written to. Before writing data to _BUFFER_###, you must write to _TARGET so the device knows how to interpret and store values.

Register: STREAM_OUT3_TARGET (STREAM_OUT#(0:3)_TARGET@3)

Address: 4046

```
property stream_resolution_index: int
```

The resolution index for stream readings. A larger resolution index generally results in lower noise and longer sample times.

Register: STREAM_RESOLUTION_INDEX

Address: 4010

```
property stream_samples_per_packet: int
```

Specifies the number of data points to be sent in the data packet. Only applies to spontaneous mode.

Register: STREAM_SAMPLES_PER_PACKET

Address: 4006

```
property stream_scanlist_address0: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS0 (STREAM_SCANLIST_ADDRESS#(0:127)@0)

Address: 4100

```
property stream_scanlist_address1: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS1 (STREAM_SCANLIST_ADDRESS#(0:127)@1)

Address: 4102

```
property stream_scanlist_address10: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS10 (STREAM_SCANLIST_ADDRESS#(0:127)@10)

Address: 4120

```
property stream_scanlist_address100: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS100 (STREAM_SCANLIST_ADDRESS#(0:127)@100)

Address: 4300

```
property stream_scanlist_address101: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS101 (STREAM_SCANLIST_ADDRESS#(0:127)@101)

Address: 4302

```
property stream_scanlist_address102: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS102 (STREAM_SCANLIST_ADDRESS#(0:127)@102)

Address: 4304

```
property stream_scanlist_address103: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS103 (STREAM_SCANLIST_ADDRESS#(0:127)@103)

Address: 4306

```
property stream_scanlist_address104: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS104 (STREAM_SCANLIST_ADDRESS#(0:127)@104)

Address: 4308

```
property stream_scanlist_address105: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS105 (STREAM_SCANLIST_ADDRESS#(0:127)@105)

Address: 4310

```
property stream_scanlist_address106: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS106 (STREAM_SCANLIST_ADDRESS#(0:127)@106)

Address: 4312

```
property stream_scanlist_address107: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS107 (STREAM_SCANLIST_ADDRESS#(0:127)@107)

Address: 4314

```
property stream_scanlist_address108: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS108 (STREAM_SCANLIST_ADDRESS#(0:127)@108)

Address: 4316

```
property stream_scanlist_address109: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS109 (STREAM_SCANLIST_ADDRESS#(0:127)@109)

Address: 4318

```
property stream_scanlist_address11: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS11 (STREAM_SCANLIST_ADDRESS#(0:127)@11)

Address: 4122

```
property stream_scanlist_address110: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS110 (STREAM_SCANLIST_ADDRESS#(0:127)@110)

Address: 4320

```
property stream_scanlist_address111: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS111 (STREAM_SCANLIST_ADDRESS#(0:127)@111)

Address: 4322

```
property stream_scanlist_address112: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS112 (STREAM_SCANLIST_ADDRESS#(0:127)@112)

Address: 4324

```
property stream_scanlist_address113: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS113 (STREAM_SCANLIST_ADDRESS#(0:127)@113)

Address: 4326

```
property stream_scanlist_address114: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS114 (STREAM_SCANLIST_ADDRESS#(0:127)@114)

Address: 4328

```
property stream_scanlist_address115: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS115 (STREAM_SCANLIST_ADDRESS#(0:127)@115)

Address: 4330

```
property stream_scanlist_address116: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS116 (STREAM_SCANLIST_ADDRESS#(0:127)@116)

Address: 4332

```
property stream_scanlist_address117: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS117 (STREAM_SCANLIST_ADDRESS#(0:127)@117)

Address: 4334

```
property stream_scanlist_address118: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS118 (STREAM_SCANLIST_ADDRESS#(0:127)@118)

Address: 4336

```
property stream_scanlist_address119: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS119 (STREAM_SCANLIST_ADDRESS#(0:127)@119)

Address: 4338

```
property stream_scanlist_address12: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS12 (STREAM_SCANLIST_ADDRESS#(0:127)@12)

Address: 4124

```
property stream_scanlist_address120: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS120 (STREAM_SCANLIST_ADDRESS#(0:127)@120)

Address: 4340

```
property stream_scanlist_address121: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS121 (STREAM_SCANLIST_ADDRESS#(0:127)@121)

Address: 4342

```
property stream_scanlist_address122: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS122 (STREAM_SCANLIST_ADDRESS#(0:127)@122)

Address: 4344

```
property stream_scanlist_address123: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS123 (STREAM_SCANLIST_ADDRESS#(0:127)@123)

Address: 4346

```
property stream_scanlist_address124: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS124 (STREAM_SCANLIST_ADDRESS#(0:127)@124)

Address: 4348

```
property stream_scanlist_address125: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS125 (STREAM_SCANLIST_ADDRESS#(0:127)@125)

Address: 4350

```
property stream_scanlist_address126: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS126 (STREAM_SCANLIST_ADDRESS#(0:127)@126)

Address: 4352

```
property stream_scanlist_address127: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS127 (STREAM_SCANLIST_ADDRESS#(0:127)@127)

Address: 4354

```
property stream_scanlist_address13: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS13 (STREAM_SCANLIST_ADDRESS#(0:127)@13)

Address: 4126

```
property stream_scanlist_address14: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS14 (STREAM_SCANLIST_ADDRESS#(0:127)@14)

Address: 4128

```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS59 (STREAM_SCANLIST_ADDRESS#(0:127)@59)

Address: 4218

```
property stream_scanlist_address6: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS6 (STREAM_SCANLIST_ADDRESS#(0:127)@6)

Address: 4112

```
property stream_scanlist_address60: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS60 (STREAM_SCANLIST_ADDRESS#(0:127)@60)

Address: 4220

```
property stream_scanlist_address61: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS61 (STREAM_SCANLIST_ADDRESS#(0:127)@61)

Address: 4222

```
property stream_scanlist_address62: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS62 (STREAM_SCANLIST_ADDRESS#(0:127)@62)

Address: 4224

```
property stream_scanlist_address63: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS63 (STREAM_SCANLIST_ADDRESS#(0:127)@63)

Address: 4226

```
property stream_scanlist_address64: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS64 (STREAM_SCANLIST_ADDRESS#(0:127)@64)

Address: 4228

```
property stream_scanlist_address65: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS65 (STREAM_SCANLIST_ADDRESS#(0:127)@65)

Address: 4230

```
property stream_scanlist_address66: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS66 (STREAM_SCANLIST_ADDRESS#(0:127)@66)

Address: 4232

```
property stream_scanlist_address67: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS67 (STREAM_SCANLIST_ADDRESS#(0:127)@67)

Address: 4234

```
property stream_scanlist_address68: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS68 (STREAM_SCANLIST_ADDRESS#(0:127)@68)

Address: 4236

```
property stream_scanlist_address69: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS69 (STREAM_SCANLIST_ADDRESS#(0:127)@69)

Address: 4238

```
property stream_scanlist_address7: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS7 (STREAM_SCANLIST_ADDRESS#(0:127)@7)

Address: 4114

```
property stream_scanlist_address70: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS70 (STREAM_SCANLIST_ADDRESS#(0:127)@70)

Address: 4240

```
property stream_scanlist_address71: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS71 (STREAM_SCANLIST_ADDRESS#(0:127)@71)

Address: 4242

```
property stream_scanlist_address72: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS72 (STREAM_SCANLIST_ADDRESS#(0:127)@72)

Address: 4244

```
property stream_scanlist_address73: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS73 (STREAM_SCANLIST_ADDRESS#(0:127)@73)

Address: 4246

property stream_scanlist_address94: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS94 (STREAM_SCANLIST_ADDRESS#(0:127)@94)

Address: 4288

```
property stream_scanlist_address95: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS95 (STREAM_SCANLIST_ADDRESS#(0:127)@95)

Address: 4290

```
property stream_scanlist_address96: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS96 (STREAM_SCANLIST_ADDRESS#(0:127)@96)

Address: 4292

```
property stream_scanlist_address97: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS97 (STREAM_SCANLIST_ADDRESS#(0:127)@97)

Address: 4294

```
property stream_scanlist_address98: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS98 (STREAM_SCANLIST_ADDRESS#(0:127)@98)

Address: 4296

```
property stream_scanlist_address99: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS99 (STREAM_SCANLIST_ADDRESS#(0:127)@99)

Address: 4298

```
property stream_scanrate_hz: float
```

Write a value to specify the number of times per second that all channels in the stream scanlist will be read. Max stream speeds are based on Sample Rate which is NumChannels*ScanRate. Has no effect when using an external clock. A read of this register returns the actual scan rate, which can be slightly different due to rounding. For scan rates >152.588, the actual scan interval is multiples of 100 ns. Assuming a core clock of 80 MHz the internal roll value is (80M/(8*DesiredScanRate))-1 and the actual scan rate is then 80M/(8*(RollValue+1). For slower scan rates the scan interval resolution is changed to 1 us, 10 us, 100 us, or 1 ms as needed to achieve the longer intervals.

Register: STREAM_SCANRATE_HZ

Address: 4002

```
property stream_settling_us: float
```

Time in microseconds to allow signals to settle after switching the mux. Does not apply to the 1st channel in the scan list, as that settling is controlled by scan rate (the time from the last channel until the start of the next scan). Default=0. When set to less than 1, automatic settling will be used. The automatic settling behavior varies by device.

Register: STREAM_SETTLING_US

Address: 4008

```
property stream_start_time_stamp: int
```

This register stores the value of CORE_TIMER at the start of the first stream scan. Note that the first stream scan happens 1 scan period after STREAM_ENABLE is set to 1.

Register: STREAM_START_TIME_STAMP

Address: 4026

```
property stream_trigger_index: int
```

Controls when stream scanning will start. 0 = Start when stream is enabled, 2000 = Start when DIO_EF0 detects an edge, 2001 = Start when DIO_EF1 detects an edge. See the stream documentation for all supported values.

Register: STREAM_TRIGGER_INDEX

Address: 4024

```
property system_counter_10khz: int
```

A 10 kHz counter synchronized to RTC_TIME_S. This register can be appended to RTC_TIME_S as the decimal portion to get 0.1 ms resolution.

Register: SYSTEM_COUNTER_10KHZ

Address: 61502

```
property system_reboot: int
```

Issues a device reboot. Must write 0x4C4Axxxx, where xxxx is number of 50ms ticks to wait before reboot. To reboot immediately write 0x4C4A0000 (d1279918080).

Register: SYSTEM_REBOOT

Address: 61998

```
property system_timer_20hz: int
```

Internal 32-bit system timer running at 20Hz.

Register: SYSTEM_TIMER_20HZ

Address: 61522

```
property tdac0: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC0 (TDAC#(0:21)@0)

Address: 30000

```
property tdac1: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC1 (TDAC#(0:21)@1)

property tdac6: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC6 (TDAC#(0:21)@6)

Address: 30012

```
property tdac7: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC7 (TDAC#(0:21)@7)

Address: 30014

```
property tdac8: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC8 (TDAC#(0:21)@8)

Address: 30016

```
property tdac9: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC9 (TDAC#(0:21)@9)

Address: 30018

```
property tdac_serial_number: int
```

Returns the serial number of an LJTick-DAC, and forces a re-read of the calibration constants. Which LJTDAC is determined by the last write to TDAC# ... whether it was successful or not.

Register: TDAC_SERIAL_NUMBER

Address: 55200

```
property tdac_speed_throttle: int
```

Sets the I2C clock speed that will be used when communicating with the TDAC. Default value is 65516. See I2C_SPEED_THROTTLE for more detail.

Register: TDAC_SPEED_THROTTLE

Address: 55202

```
property temperature_air_k: float
```

Returns the estimated ambient air temperature just outside of the device in its red plastic enclosure. This register is equal to TEMPERATURE_DEVICE_K - 4.3. If Ethernet and/or WiFi is enabled, subtract an extra 0.6 for each.

Register: TEMPERATURE_AIR_K

Address: 60050

```
property temperature_device_k: float
```

Takes a reading from the internal temperature sensor using range=+/-10V and resolution=8, and applies the formula Volts*-92.6+467.6 to return kelvins.

Register: TEMPERATURE_DEVICE_K

Address: 60052

```
property test: int
```

A read of this test register should always return 0x00112233 or d1122867. If your software has the word swap quirk, you will incorrectly read 0x22330011 or 573767697. If your software has the address-1 quirk, a UINT16 (1-register) read from 55101 will incorrectly return 0x0011 (should read 0x2233). This register is unlike others, in that it allows you can read a single word from 55100 or 55101, or of course 2 words from 55100.

Register: TEST

Address: 55100

```
property test_float32: float
```

Write a value and read back to test FLOAT32 operation. Default is 0xC61C3C00 or -9999.0. If your software has the word swap quirk, the default will incorrectly read 0x3C00C61C or 0.00786.

Register: TEST_FLOAT32

Address: 55124

```
property test_int32: int
```

Write a value and read back to test INT32 operation. Default is 0x8899AABB or d-2003195205. If your software has the word swap quirk, the default will incorrectly read 0xAABB8899 or -1430550375.

Register: TEST_INT32

Address: 55122

```
property test_uint16: int
```

Write a value and read back to test UINT16 operation. Default is 0x0011 or d17.

Register: TEST_UINT16

Address: 55110

```
property test_uint32: int
```

Write a value and read back to test UINT32 operation. Default is 0x00112233 or d1122867. If your software has the word swap quirk, the default will incorrectly read 0x22330011 or 573767697.

Register: TEST_UINT32

Address: 55120

```
property user_ram0_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM0_F32 (USER_RAM#(0:39)_F32@0)

Address: 46000

```

```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM4_U32 (USER_RAM#(0:39)_U32@4)

Address: 46108

```
property user_ram5_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM5_F32 (USER_RAM#(0:39)_F32@5)

Address: 46010

```
property user_ram5_i32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM5_I32 (USER_RAM#(0:9)_I32@5)

Address: 46090

```
property user_ram5_u16: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM5_U16 (USER_RAM#(0:19)_U16@5)

Address: 46185

```
property user_ram5_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM5_U32 (USER_RAM#(0:39)_U32@5)

Address: 46110

```
property user_ram6_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM6_F32 (USER_RAM#(0:39)_F32@6)

Address: 46012

```
property user_ram6_i32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM6_I32 (USER_RAM#(0:9)_I32@6)

Address: 46092

```
property user_ram6_u16: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM6_U16 (USER_RAM#(0:19)_U16@6)

Address: 46186

```
property user_ram6_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM6_U32 (USER_RAM#(0:39)_U32@6)

Address: 46112

```
property user_ram7_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM7_F32 (USER_RAM#(0:39)_F32@7)

Address: 46014

```
property user_ram7_i32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM7_I32 (USER_RAM#(0:9)_I32@7)

Address: 46094

```
property user_ram7_u16: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM7_U16 (USER_RAM#(0:19)_U16@7)

Address: 46187

```
property user_ram7_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM7_U32 (USER_RAM#(0:39)_U32@7)

Address: 46114

```
property user_ram8_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM8_F32 (USER_RAM#(0:39)_F32@8)

Address: 46016

```
property user_ram8_i32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM8_I32 (USER_RAM#(0:9)_I32@8)

Address: 46096

```
property user_ram8_u16: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM8_U16 (USER_RAM#(0:19)_U16@8)

Address: 46188

```
property user_ram8_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM8_U32 (USER_RAM#(0:39)_U32@8)

Address: 46116

```
property user_ram9_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM9_F32 (USER_RAM#(0:39)_F32@9)

Address: 46018

```
property user_ram9_i32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM9_I32 (USER_RAM#(0:9)_I32@9)

Address: 46098

```
property user_ram9_u16: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM9_U16 (USER_RAM#(0:19)_U16@9)

Address: 46189

```
property user_ram9_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM9_U32 (USER_RAM#(0:39)_U32@9)

Address: 46118

```
property user_ram_fifo0_allocate_num_bytes: int
```

Allocate memory for a FIFO buffer. Number of bytes should be sufficient to store users max transfer array size. Note that FLOAT32, INT32, and UINT32 require 4 bytes per value, and UINT16 require 2 bytes per value. Maximum size is limited by available memory. Care should be taken to conserve enough memory for other operations such as AIN_EF, Lua, Stream etc.

Register: USER_RAM_FIFO0_ALLOCATE_NUM_BYTES
(USER_RAM_FIFO#(0:3)_ALLOCATE_NUM_BYTES@0)

Address: 47900

```
property user_ram_fifo0_data_f32: float
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO0_DATA_F32 (USER_RAM_FIFO#(0:3)_DATA_F32@0)

Address: 47030

```
property user_ram_fifo0_data_i32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO0_DATA_I32 (USER_RAM_FIFO#(0:3)_DATA_I32@0)

Address: 47020

```
property user_ram_fifo0_data_u16: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO0_DATA_U16 (USER_RAM_FIFO#(0:3)_DATA_U16@0)

Address: 47000

```
property user_ram_fifo0_data_u32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO0_DATA_U32 (USER_RAM_FIFO#(0:3)_DATA_U32@0)

Address: 47010

```
property user_ram_fifo0_empty: int
```

Write any value to this register to efficiently empty, flush, or otherwise clear data from the FIFO.

Register: USER_RAM_FIFO0_EMPTY (USER_RAM_FIFO#(0:3)_EMPTY@0)

Address: 47930

```
property user_ram_fifo0_num_bytes_in_fifo: int
```

Poll this register to see when new data is available/ready. Each read of the FIFO buffer decreases this value, and each write to the FIFO buffer increases this value.

At any point in time, the following equation holds: Nbytes = Nwritten - Nread.

Register: USER_RAM_FIFO0_NUM_BYTES_IN_FIFO
(USER_RAM_FIFO#(0:3)_NUM_BYTES_IN_FIFO@0)

Address: 47910

```
property user_ram_fifo1_allocate_num_bytes: int
```

Allocate memory for a FIFO buffer. Number of bytes should be sufficient to store users max transfer array size. Note that FLOAT32, INT32, and UINT32 require 4 bytes per value, and UINT16 require 2 bytes per value. Maximum size is limited by available memory. Care should be taken to conserve enough memory for other operations such as AIN_EF, Lua, Stream etc.

Register: USER_RAM_FIFO1_ALLOCATE_NUM_BYTES
(USER_RAM_FIFO#(0:3)_ALLOCATE_NUM_BYTES@1)

Address: 47902

```
property user_ram_fifo1_data_f32: float
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO1_DATA_F32 (USER_RAM_FIFO#(0:3)_DATA_F32@1)

Address: 47032

```
property user_ram_fifo1_data_i32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO1_DATA_I32 (USER_RAM_FIFO#(0:3)_DATA_I32@1)

Address: 47022

```
property user_ram_fifo1_data_u16: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO1_DATA_U16 (USER_RAM_FIFO#(0:3)_DATA_U16@1)

Address: 47001

```
property user_ram_fifo1_data_u32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO1_DATA_U32 (USER_RAM_FIFO#(0:3)_DATA_U32@1)

Address: 47012

```
property user_ram_fifo1_empty: int
```

Write any value to this register to efficiently empty, flush, or otherwise clear data from the FIFO.

Register: USER_RAM_FIFO1_EMPTY (USER_RAM_FIFO#(0:3)_EMPTY@1)

Address: 47932

```
property user_ram_fifo1_num_bytes_in_fifo: int
```

Poll this register to see when new data is available/ready. Each read of the FIFO buffer decreases this value, and each write to the FIFO buffer increases this value.

At any point in time, the following equation holds: Nbytes = Nwritten - Nread.

Register: USER_RAM_FIFO1_NUM_BYTES_IN_FIFO
(USER_RAM_FIFO#(0:3)_NUM_BYTES_IN_FIFO@1)

Address: 47912

```
property user_ram_fifo2_allocate_num_bytes: int
```

Allocate memory for a FIFO buffer. Number of bytes should be sufficient to store users max transfer array size. Note that FLOAT32, INT32, and UINT32 require 4 bytes per value, and UINT16 require 2 bytes per value. Maximum size is limited by available memory. Care should be taken to conserve enough memory for other operations such as AIN_EF, Lua, Stream etc.

Register: USER_RAM_FIFO2_ALLOCATE_NUM_BYTES
(USER_RAM_FIFO#(0:3)_ALLOCATE_NUM_BYTES@2)

Address: 47904

```
property user_ram_fifo2_data_f32: float
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO2_DATA_F32 (USER_RAM_FIFO#(0:3)_DATA_F32@2)

Address: 47034

```
property user_ram_fifo2_data_i32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO2_DATA_I32 (USER_RAM_FIFO#(0:3)_DATA_I32@2)

Address: 47024

```
property user_ram_fifo2_data_u16: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO2_DATA_U16 (USER_RAM_FIFO#(0:3)_DATA_U16@2)

Address: 47002

```
property user_ram_fifo2_data_u32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO2_DATA_U32 (USER_RAM_FIFO#(0:3)_DATA_U32@2)

Address: 47014

```
property user_ram_fifo2_empty: int
```

Write any value to this register to efficiently empty, flush, or otherwise clear data from the FIFO.

Register: USER_RAM_FIFO2_EMPTY (USER_RAM_FIFO#(0:3)_EMPTY@2)

Address: 47934

```
property user_ram_fifo2_num_bytes_in_fifo: int
```

Poll this register to see when new data is available/ready. Each read of the FIFO buffer decreases this value, and each write to the FIFO buffer increases this value.

At any point in time, the following equation holds: Nbytes = Nwritten - Nread.

Register: USER_RAM_FIFO2_NUM_BYTES_IN_FIFO
(USER_RAM_FIFO#(0:3)_NUM_BYTES_IN_FIFO@2)

Address: 47914

```
property user_ram_fifo3_allocate_num_bytes: int
```

Allocate memory for a FIFO buffer. Number of bytes should be sufficient to store users max transfer array size. Note that FLOAT32, INT32, and UINT32 require 4 bytes per value, and UINT16 require 2 bytes per value. Maximum size is limited by available memory. Care should be taken to conserve enough memory for other operations such as AIN_EF, Lua, Stream etc.

Register: USER_RAM_FIFO3_ALLOCATE_NUM_BYTES
(USER_RAM_FIFO#(0:3)_ALLOCATE_NUM_BYTES@3)

Address: 47906

```
property user_ram_fifo3_data_f32: float
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO3_DATA_F32 (USER_RAM_FIFO#(0:3)_DATA_F32@3)

Address: 47036

```
property user_ram_fifo3_data_i32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO3_DATA_I32 (USER_RAM_FIFO#(0:3)_DATA_I32@3)

Address: 47026

```
property user_ram_fifo3_data_u16: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO3_DATA_U16 (USER_RAM_FIFO#(0:3)_DATA_U16@3)

Address: 47003

```
property user_ram_fifo3_data_u32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO3_DATA_U32 (USER_RAM_FIFO#(0:3)_DATA_U32@3)

Address: 47016

```
property user_ram_fifo3_empty: int
```

Write any value to this register to efficiently empty, flush, or otherwise clear data from the FIFO.

Register: USER_RAM_FIFO3_EMPTY (USER_RAM_FIFO#(0:3)_EMPTY@3)

Address: 47936

```
property user_ram_fifo3_num_bytes_in_fifo: int
```

Poll this register to see when new data is available/ready. Each read of the FIFO buffer decreases this value, and each write to the FIFO buffer increases this value.

At any point in time, the following equation holds: Nbytes = Nwritten - Nread.

Register: USER_RAM_FIFO3_NUM_BYTES_IN_FIFO
(USER_RAM_FIFO#(0:3)_NUM_BYTES_IN_FIFO@3)

Address: 47916

```
property wait_us_blocking: int
```

Delays for x microseconds. Range is 0-100000. This operation is Blocking. While a blocking function is running no other registers can be read / written.

Register: WAIT_US_BLOCKING

Address: 61590

```
property watchdog_advanced_default: int
```

A single binary-encoded value where each bit is an advanced option. If bit 0 is set, IO_CONFIG_SET_CURRENT_TO_FACTORY will be done on timeout. If bit 1 is set, IO_CONFIG_SET_CURRENT_TO_DEFAULT will be done on timeout.

Register: WATCHDOG_ADVANCED_DEFAULT

Address: 61602

```
property watchdog_dac0_default: float
```

The voltage of DAC0 after a Watchdog timeout.

Register: WATCHDOG_DAC0_DEFAULT

Address: 61642

```
property watchdog_dac0_enable_default: int
```

Timeout action: Set to 1 to enable DAC0 update on watchdog timeout.

Register: WATCHDOG_DAC0_ENABLE_DEFAULT

Address: 61640

```
property watchdog_dac1_default: float
```

The voltage of DAC1 after a Watchdog timeout.

Register: WATCHDOG_DAC1_DEFAULT

Address: 61652

```
property watchdog_dac1_enable_default: int
```

Timeout action: Set to 1 to enable DAC1 update on watchdog timeout.

Register: WATCHDOG_DAC1_ENABLE_DEFAULT

Address: 61650

```
property watchdog_dio_direction_default: int
```

The direction input/output of the digital I/O after a Watchdog timeout. See DIO_DIRECTION.

Register: WATCHDOG_DIO_DIRECTION_DEFAULT

Address: 61634

```
property watchdog_dio_enable_default: int
```

Timeout action: Set to 1 to enable DIO update on watchdog timeout.

Register: WATCHDOG_DIO_ENABLE_DEFAULT

Address: 61630

```
property watchdog_dio_inhibit_default: int
```

This register can be used to prevent the watchdog from changing specific IO. See DIO_INHIBIT for more information.

Register: WATCHDOG_DIO_INHIBIT_DEFAULT

Address: 61636

```
property watchdog_dio_state_default: int
```

The state high/low of the digital I/O after a Watchdog timeout. See DIO_STATE.

Register: WATCHDOG_DIO_STATE_DEFAULT

Address: 61632

```
property watchdog_enable_default: int
```

Write a 1 to enable the watchdog or a 0 to disable. The watchdog must be disabled before writing any of the other watchdog registers (except for WATCHDOG_STRICT_CLEAR).

Register: WATCHDOG_ENABLE_DEFAULT

Address: 61600

```
property watchdog_reset_enable_default: int
```

Timeout action: Set to 1 to enable device-reset on watchdog timeout.

Register: WATCHDOG_RESET_ENABLE_DEFAULT

Address: 61620

```
property watchdog_startup_delay_s_default: int
```

This specifies the initial timeout period at device bootup. This is used until the first time the watchdog is cleared or timeout ... after that the normal timeout is used.

Register: WATCHDOG_STARTUP_DELAY_S_DEFAULT

Address: 61606

```
property watchdog_strict_clear: int
```

When running in strict mode, writing the key to this register is the only way to clear the watchdog. Writing to this register while not using strict mode will clear the watchdog.

Register: WATCHDOG_STRICT_CLEAR

Address: 61614

```
property watchdog_strict_enable_default: int
```

Set to 1 to enable strict mode.

Register: WATCHDOG_STRICT_ENABLE_DEFAULT

Address: 61610

```
property watchdog_strict_key_default: int
```

When set to strict mode, this is the value that must be written to the clear register.

Register: WATCHDOG_STRICT_KEY_DEFAULT

Address: 61612

```
property watchdog_timeout_s_default: int
```

When the device receives any communication over USB/Ethernet/WiFi, the watchdog timer is cleared. If the watchdog timer is not cleared within the timeout period, the enabled actions will be done.

Register: WATCHDOG_TIMEOUT_S_DEFAULT

Address: 61604

```
property wifi_apply_settings: int
```

Apply all new WiFi settings: IP, Subnet, Gateway, DHCP, SSID, Password. 1=Apply

Register: WIFI_APPLY_SETTINGS

Address: 49400

```
property wifi_dhcp_enable: int
```

Read the current Enabled/Disabled state of WiFi DHCP.

Register: WIFI_DHCP_ENABLE

Address: 49210

```
property wifi_dhcp_enable_default: int
```

The new Enabled/Disabled state of WiFi DHCP. Use WIFI_APPLY_SETTINGS.

Register: WIFI_DHCP_ENABLE_DEFAULT

Address: 49260

```
property wifi_firmware_update_status: int
```

CONFIGURING = 2920, IN_PROGRESS = 2921, REBOOTING = 2923, UPDATE_SUCCESS = 2924, UPDATE_FAILED = 2925.

Register: WIFI_FIRMWARE_UPDATE_STATUS

Address: 49454

```
property wifi_firmware_update_to_versionx: float
```

Start an update by using USB or Ethernet to write the desired version to update to.

Register: WIFI_FIRMWARE_UPDATE_TO_VERSIONX

Address: 49402

```
property wifi_gateway: str
```

Read the current gateway of WiFi.

Register: WIFI_GATEWAY

Address: 49204

```
property wifi_gateway_default: str
```

The new gateway of WiFi. Use WIFI_APPLY_SETTINGS.

Register: WIFI_GATEWAY_DEFAULT

Address: 49254

```
property wifi_ip: str
```

Read the current IP address of WiFi.

Register: WIFI_IP

Address: 49200

```
property wifi_ip_default: str
```

The new IP address of WiFi. Use WIFI_APPLY_SETTINGS.

Register: WIFI_IP_DEFAULT

Address: 49250

```
property wifi_mac: str
```

The MAC address of the WiFi module.

Register: WIFI_MAC

Address: 60024

```
property wifi_password_default: str
```

Write the password for the WiFi network, then use WIFI_APPLY_SETTINGS.

Register: WIFI_PASSWORD_DEFAULT

Address: 49350

```
property wifi_rssi: float
```

WiFi RSSI (signal strength). Typical values are -40 for very good, and -75 for very weak. The T7 microcontroller only gets a new RSSI value from the WiFi module when WiFi communication occurs.

Register: WIFI_RSSI

Address: 49452

```
property wifi_ssid: str
```

Read the current SSID (network name) of WiFi.

Register: WIFI_SSID

Address: 49300

```
property wifi_ssid_default: str
```

The new SSID (network name) of WiFi. Use WIFI_APPLY_SETTINGS.

Register: WIFI_SSID_DEFAULT

Address: 49325

```
property wifi_status: int
```

Status Codes: ASSOCIATED = 2900, ASSOCIATING = 2901, ASSOCIATION_FAILED = 2902, UNPOWERED = 2903, BOOTING = 2904, START_FAILED = 2905, APPLYING_SETTINGS = 2906, DHCP_STARTED = 2907, OTHER = 2909

Register: WIFI_STATUS

Address: 49450

```
property wifi_subnet: str
```

Read the current subnet of WiFi.

Register: WIFI_SUBNET

Address: 49202

```
property wifi_subnet_default: str
```

The new subnet of WiFi. Use WIFI_APPLY_SETTINGS.

Register: WIFI_SUBNET_DEFAULT

Address: 49252

```
property wifi_udp_discovery_only: int
```

Restricts which Modbus operations are allowed over UDP. When set to 1, only the registers needed for discovering units can be read and any other operation will throw an error.

Register: WIFI_UDP_DISCOVERY_ONLY

Address: 49215

```
property wifi_udp_discovery_only_default: int
```

The Enabled/Disabled state of WIFI_UDP_DISCOVERY_ONLY after a power-cycle to the device.

Register: WIFI_UDP_DISCOVERY_ONLY_DEFAULT

Address: 49265

```
property wifi_version: float
```

The current firmware version of the WiFi module, if available.

Register: WIFI_VERSION

Address: 60008

LabJack T8

```
class htf.labjack.T8(*, name: str | None = None, host: str | None = None, port: int = 502,
debuglevel: int = 0, timeout: float = 1.0, retries: int = 0)
```

LabJack adapter for the T8.

Parameters:

- **name** – If name is set the USB device's name is checked against it. If host is None a USB device is opened.
- **host** – If host is set a Modbus-TCP connection is opened. Name must not be set at the same time.
- **port** – The Modbus-TCP port to be used
- **debuglevel** – If set the Modbus packets are printed
- **timeout** – The timeout for every request
- **retries** – The number of retries for Modbus communication

```
property ain0: float
```

Returns the voltage of the specified analog input.

Register: AIN0 (AIN#(0:7)@0)

Address: 0

```
property ain0_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN0_BINARY (AIN#(0:7)_BINARY@0)

Address: 50000

```
property ain0_binary_capture: int
```

T8 Only. Returns the saved 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN0_BINARY_CAPTURE (AIN#(0:7)_BINARY_CAPTURE@0)

Address: 50650

```
property ain0_capture: float
```

T8 Only. Returns the saved voltage of the specified analog input.

Register: AIN0_CAPTURE (AIN#(0:7)_CAPTURE@0)

Address: 650

```
property ain0_ef_config_a: int
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_A (AIN#(0:149)_EF_CONFIG_A@0)

Address: 9300

```
property ain0_ef_config_b: int
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_B (AIN#(0:149)_EF_CONFIG_B@0)

Address: 9600

```
property ain0_ef_config_c: int
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_C (AIN#(0:149)_EF_CONFIG_C@0)

Address: 9900

```
property ain0_ef_config_d: float
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_D (AIN#(0:149)_EF_CONFIG_D@0)

Address: 10200

```
property ain0_ef_config_e: float
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_E (AIN#(0:149)_EF_CONFIG_E@0)

Address: 10500

```
property ain0_ef_config_f: float
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_F (AIN#(0:149)_EF_CONFIG_F@0)

Address: 10800

```
property ain0_ef_config_g: float
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_G (AIN#(0:149)_EF_CONFIG_G@0)

Address: 11100

```
property ain0_ef_config_h: float
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_H (AIN#(0:149)_EF_CONFIG_H@0)

Address: 11400

```
property ain0_ef_config_i: float
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_I (AIN#(0:149)_EF_CONFIG_I@0)

Address: 11700

```
property ain0_ef_config_j: float
```

Function dependent on selected feature index.

Register: AIN0_EF_CONFIG_J (AIN#(0:149)_EF_CONFIG_J@0)

Address: 12000

```
property ain0_ef_index: int
```

Specify the desired extended feature for this analog input with the index value. List of index values: 0=None(disabled); 1=Offset and Slope; 3=Max/Min/Avg; 4=Resistance; 5=Average and Threshold; 10=RMS Flex; 11=FlexRMS; 20=Thermocouple type E; 21=Thermocouple type J; 22=Thermocouple type K; 23=Thermocouple type R; 24=Thermocouple type T; 25=Thermocouple type S; 27=Thermocouple type N; 28=Thermocouple type B; 30=Thermocouple type C; 40=RTD model PT100; 41=RTD model PT500; 42=RTD model PT1000; 50=Thermistor Steinhart-Hart; 51=Thermistor Beta.

Register: AIN0_EF_INDEX (AIN#(0:149)_EF_INDEX@0)

Address: 9000

```
property ain0_ef_read_a: float
```

Function dependent on selected feature index.

Register: AIN0_EF_READ_A (AIN#(0:149)_EF_READ_A@0)

Address: 7000

```
property ain0_ef_read_b: float
```

Function dependent on selected feature index.

Register: AIN0_EF_READ_B (AIN#(0:149)_EF_READ_B@0)

Address: 7300

```
property ain0_ef_read_c: float
```

Function dependent on selected feature index.

Register: AIN0_EF_READ_C (AIN#(0:149)_EF_READ_C@0)

Address: 7600

```
property ain0_ef_read_d: float
```

Function dependent on selected feature index.

Register: AIN0_EF_READ_D (AIN#(0:149)_EF_READ_D@0)

Address: 7900

```
property ain0_negative_ch: int
```

Specifies the negative channel to be used for each positive channel. 199=Default=> Single-Ended.

Register: AIN0_NEGATIVE_CH (AIN#(0:7)_NEGATIVE_CH@0)

Address: 41000

```
property ain0_range: float
```

The range/span of each analog input. Write the highest expected input voltage.

Register: AIN0_RANGE (AIN#(0:7)_RANGE@0)

Address: 40000

```
property ain0_resolution_index: int
```

The resolution index for command-response and AIN-EF readings. A larger resolution index generally results in lower noise and longer sample times.

Register: AIN0_RESOLUTION_INDEX (AIN#(0:7)_RESOLUTION_INDEX@0)

Address: 41500

```
property ain0_settling_us: float
```

Settling time for command-response and AIN-EF readings.

Register: AIN0_SETTLING_US (AIN#(0:7)_SETTLING_US@0)

Address: 42000

```
property ain1: float
```

Returns the voltage of the specified analog input.

Register: AIN1 (AIN#(0:7)@1)

Address: 2

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN1_BINARY (AIN#(0:7)_BINARY@1)

Address: 50002

```

```

Function dependent on selected feature index.

Register: AIN1_EF_READ_C (AIN#(0:149)_EF_READ_C@1)

Address: 7602

```
property ain1_ef_read_d: float
```

Function dependent on selected feature index.

Register: AIN1_EF_READ_D (AIN#(0:149)_EF_READ_D@1)

Address: 7902

```
property ain1_negative_ch: int
```

Specifies the negative channel to be used for each positive channel. 199=Default=> Single-Ended.

Register: AIN1_NEGATIVE_CH (AIN#(0:7)_NEGATIVE_CH@1)

Address: 41001

```
property ain1_range: float
```

The range/span of each analog input. Write the highest expected input voltage.

Register: AIN1_RANGE (AIN#(0:7)_RANGE@1)

Address: 40002

```
property ain1_resolution_index: int
```

The resolution index for command-response and AIN-EF readings. A larger resolution index generally results in lower noise and longer sample times.

Register: AIN1_RESOLUTION_INDEX (AIN#(0:7)_RESOLUTION_INDEX@1)

Address: 41501

```
property ain1_settling_us: float
```

Settling time for command-response and AIN-EF readings.

Register: AIN1_SETTLING_US (AIN#(0:7)_SETTLING_US@1)

Address: 42002

```
property ain2: float
```

Returns the voltage of the specified analog input.

Register: AIN2 (AIN#(0:7)@2)

Address: 4

```
property ain4_binary: int
```

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN4_BINARY (AIN#(0:7)_BINARY@4)

Address: 50008

```
property ain4_binary_capture: int
```

T8 Only. Returns the saved 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN4_BINARY_CAPTURE (AIN#(0:7)_BINARY_CAPTURE@4)

Returns the 24-bit binary representation of the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: AIN5_BINARY (AIN#(0:7)_BINARY@5)

property ain_all_ef_index: int
```

Write 0 to deactivate AIN_EF on all AINs. No other values may be written to this register. Reads will return the AIN_EF index if all 128 AINs are set to the same value. If values are not the same returns 0xFFFF (65535).

Register: AIN_ALL_EF_INDEX

Address: 43906

```
property ain_all_negative_ch: int
```

A write to this global parameter affects all AIN. Writing 1 will set all AINs to differential. Writing 199 will set all AINs to single-ended. A read will return 1 if all AINs are set to differential and 199 if all AINs are set to single-ended. If AIN configurations are not consistent 0xFFFF will be returned.

Register: AIN_ALL_NEGATIVE_CH

Address: 43902

```
property ain_all_range: float
```

A write to this global parameter affects all AIN. A read will return the correct setting if all channels are set the same, but otherwise will return -9999.

Register: AIN_ALL_RANGE

Address: 43900

```
property ain_all_resolution_index: int
```

The resolution index for command-response and AIN-EF readings. A larger resolution index generally results in lower noise and longer sample times. A write to this global parameter affects all AIN. A read will return the correct setting if all channels are set the same, but otherwise will return 0xFFFF.

Register: AIN_ALL_RESOLUTION_INDEX

Address: 43903

```
property ain_all_settling_us: float
```

Settling time for command-response and AIN-EF readings. A write to this global parameter affects all AIN. A read will return the correct setting if all channels are set the same, but otherwise will return -9999. Max is 50,000 us.

Register: AIN_ALL_SETTLING_US

Address: 43904

```
property ain_channel_enable: int
```

T8 Only. This register is a bitmask representing the enable states of the analog inputs.

Register: AIN_CHANNEL_ENABLE

Address: 43700

```
property ain_sampling_rate_actual_hz: float
```

T8 Only. Returns the AIN system's actual sampling rate.

Register: AIN_SAMPLING_RATE_ACTUAL_HZ

Address: 43712

```
property ain_sampling_rate_hz: float
```

T8 Only. Writing to this register sets the analog sampling rate. Not all rates are possible. Read AIN_SAMPLING_RATE_ACTUAL_HZ to get the actual rate.

Register: AIN_SAMPLING_RATE_HZ

Address: 43710

```
property asynch_baud: int
```

The symbol rate that will be used for communication. 9600 is typical. Up to 38400 works, but heavily loads the T7's processor.

Register: ASYNCH_BAUD

Address: 5420

```
property asynch_data_rx: int
```

Read received data from here.

This register is a buffer. Underrun behavior - fill with zeros.

Register: ASYNCH_DATA_RX

Address: 5495

```
property asynch_data_tx: int
```

Write data to be transmitted here. This register is a buffer.

Register: ASYNCH_DATA_TX

Address: 5490

```
property asynch_enable: int
```

1 = Turn on Asynch. Configures timing hardware, DIO lines and allocates the receiving buffer.

Register: ASYNCH_ENABLE

Address: 5400

```
property asynch_num_bytes_rx: int
```

The number of data bytes that have been received.

Register: ASYNCH_NUM_BYTES_RX

Address: 5435

```
property asynch_num_bytes_tx: int
```

The number of bytes to be transmitted after writing to GO. Max is 256.

Register: ASYNCH_NUM_BYTES_TX

Address: 5440

```
property asynch_num_data_bits: int
```

The number of data bits per frame. 0-8, 0=8.

Register: ASYNCH_NUM_DATA_BITS

Address: 5415

```
property asynch_num_parity_errors: int
```

The number of parity errors that have been detected. Cleared when UART is enabled. Can also be cleared by writing 0.

Register: ASYNCH_NUM_PARITY_ERRORS

Address: 5465

```
property asynch_num_stop_bits: int
```

The number of stop bits. Values: 0 = zero stop bits, 1 = one stop bit, 2 = two stop bits.

Register: ASYNCH_NUM_STOP_BITS

Address: 5455

```
property asynch_parity: int
```

Parity setting: 0=none, 1=odd, 2=even.

Register: ASYNCH_PARITY

Address: 5460

```
property asynch_rx_buffer_size_bytes: int
```

Number of bytes to use for the receiving buffer. Max is 2048. 0 = 200.

Register: ASYNCH_RX_BUFFER_SIZE_BYTES

Address: 5430

```
property asynch_rx_dionum: int
```

The DIO line that will receive data. (RX)

Register: ASYNCH_RX_DIONUM

Address: 5405

```
property asynch_tx_dionum: int
```

The DIO line that will transmit data. (TX)

Register: ASYNCH_TX_DIONUM

Address: 5410

```
property asynch_tx_go: int
```

Write a 1 to this register to initiate a transmission.

Register: ASYNCH_TX_GO

Address: 5450

```
property bootloader_version: float
```

The bootloader version installed on the main processor.

Register: BOOTLOADER_VERSION

Address: 60006

```
property calibration_constants_status: float
```

T8 Only. Returns the status of the calibration data saved in flash. 1 = calibration looks good. 0 = calibration invalid.

Register: CALIBRATION_CONSTANTS_STATUS

Address: 60091

```
property calibration_source: int
```

T8 Only. Sets and reads the source of the current set of calibration constants. 0 = no calibration. 1 = binary calibration, 2 = Calibration set from Flash, 3 = Nominal Calibration. When setting to 2, the constants will be checked and if invalid 1 will be used instead.

Register: CALIBRATION_SOURCE

Address: 60092

```
property cio0: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: CIO0 (CIO#(0:3)@0)

Address: 2016

```
property cio1: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: CIO1 (CIO#(0:3)@1)

Address: 2017

```
property cio2: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: CIO2 (CIO#(0:3)@2)

Address: 2018

```
property cio3: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: CIO3 (CIO#(0:3)@3)

Address: 2019

```
property cio_direction: int
```

Read or write the direction of the 4 bits of CIO in a single binary-encoded value. 0=Input and 1=Output. The upper 8-bits of this value are inhibits.

Register: CIO_DIRECTION

Address: 2602

```
property cio_mio_state: int
```

Read or write the state of the 12 bits of CIO-MIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written.

Register: CIO_MIO_STATE

Address: 2582

```
property cio_state: int
```

Read or write the state of the 4 bits of CIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written. The upper 8-bits of this value are inhibits.

Register: CIO_STATE

Address: 2502

```
property cleanse: int
```

Writing 0x5317052E to this register will trigger a system cleanse.

Register: CLEANSE

Address: 49090

```
property core_timer: int
```

Internal 32-bit system timer running at 1/2 core speed, thus normally 80M/2 => 40 MHz.

Register: CORE_TIMER

Address: 61520

```
property current_source_10ua_cal_value: float
```

Fixed current source value in Amps for the 10UA terminal. This value is stored during factory calibration, it is not a current reading. Using the equation V=IR, with a known current and voltage, it is possible to calculate resistance of RTDs.

Register: CURRENT_SOURCE_10UA_CAL_VALUE

Address: 1900

```
property current_source_200ua_cal_value: float
```

Fixed current source value in Amps for the 200UA terminal. This value is stored during factory calibration, it is not a current reading. Using the equation V=IR, with a known current and voltage, it is possible to calculate resistance of RTDs.

Register: CURRENT_SOURCE_200UA_CAL_VALUE

Address: 1902

```
property dac0: float
```

Pass a voltage for the specified analog output.

Register: DAC0 (DAC#(0:1)@0)

Address: 1000

```
property dac0_binary: int
```

Writes binary values to the DACs. Binary values are 16-bit. If the DAC's resolution is less than 16 then the lower bits are ignored. 0 = lowest output, 65535 = highest output.

Register: DAC0_BINARY (DAC#(0:1)_BINARY@0)

Address: 51000

```
property dac1: float
```

Pass a voltage for the specified analog output.

Register: DAC1 (DAC#(0:1)@1)

Address: 1002

```
property dac1_binary: int
```

Writes binary values to the DACs. Binary values are 16-bit. If the DAC's resolution is less than 16 then the lower bits are ignored. 0 = lowest output, 65535 = highest output.

Register: DAC1_BINARY (DAC#(0:1)_BINARY@1)

Address: 51002

```
property dac1_frequency_out_enable: int
```

0 = off, 1 = output 10 Hz signal on DAC1. The signal will be a square wave with peaks of 0 and 3.3V. Note that writing to DAC1 or enabling a stream out which is targeting DAC1 will disable this feature.

Register: DAC1_FREQUENCY_OUT_ENABLE

Address: 61532

```
property device_name_default: str
```

Reads return the current device name. Writes update the default and current device name. A reboot is necessary to update the name reported by NBNS. Up to 49 characters, cannot contain periods.

Register: DEVICE_NAME_DEFAULT

Address: 60500

```
property device_reset_dbg_reg: int
```

Bitmask register that indicates why a device was last re-set. bit0: Power-on reset, bit1: Brown-out, bit2: Wake from idle, bit3: Wake from sleep, bit4: watchdog timer time-out, bit5: reserved, bit6: Software reset, bit7: external reset (MCLR), bit8: Voltage regulator standby, bit9: Configuration mismatch.

Register: DEVICE_RESET_DBG_REG

Address: 60014

```
property dio0_ef_config_a: int
```

Function dependent on selected feature index.

Register: DIO0_EF_CONFIG_A (DIO#(0:22)_EF_CONFIG_A@0)

Address: 44300

```
property dio0_ef_config_b: int
```

Function dependent on selected feature index.

Register: DIO0_EF_CONFIG_B (DIO#(0:22)_EF_CONFIG_B@0)

Address: 44400

```
property dio0_ef_config_c: int
```

Function dependent on selected feature index.

Register: DIO0_EF_CONFIG_C (DIO#(0:22)_EF_CONFIG_C@0)

Address: 44500

```
property dio0_ef_config_d: int
```

Function dependent on selected feature index.

Register: DIO0_EF_CONFIG_D (DIO#(0:22)_EF_CONFIG_D@0)

Address: 44600

```
property dio0_ef_easy_frequency_in: float
```

Deprecated. Automatically configures the associated DIO_EF for feature index 11. If already configured for index 11, reads the result and resets the DIO_EF.

Register: DIO0_EF_EASY_FREQUENCY_IN (DIO#(0:22)_EF_EASY_FREQUENCY_IN@0)

Address: 45000

```
property dio0_ef_enable: int
```

1 = enabled. 0 = disabled. Must be disabled during configuration. Note that DIO-EF reads work when disabled and do not return an error.

Register: DIO0_EF_ENABLE (DIO#(0:22)_EF_ENABLE@0)

Address: 44000

```
property dio0_ef_index: int
```

An index to specify the feature you want.

Register: DIO0_EF_INDEX (DIO#(0:22)_EF_INDEX@0)

Address: 44100

```
property dio0_ef_options: int
```

Function dependent on selected feature index.

Register: DIO0_EF_OPTIONS (DIO#(0:22)_EF_OPTIONS@0)

Address: 44200

```
property dio0_ef_read_a: int
```

Reads an unsigned integer value. The meaning of the integer is dependent on selected feature index.

Register: DIO0_EF_READ_A (DIO#(0:22)_EF_READ_A@0)

Address: 3000

```
property dio0_ef_read_a_and_reset: int
```

22)_EF_READ_A and forces a reset.

Register: DIO0_EF_READ_A_AND_RESET (DIO#(0:22)_EF_READ_A_AND_RESET@0)

Address: 3100

Type:
Reads the same value as DIO#(0

```
property dio0_ef_read_a_f: float
```

Reads a floating point value. The meaning of value is dependent on selected feature index.

Register: DIO_EF_CLOCK2_ROLL_VALUE

Address: 44924

```
property dio_inhibit: int
```

A single binary-encoded value where each bit determines whether _STATE, _DIRECTION or _ANALOG_ENABLE writes affect that bit of digital I/O. 0=Default=Affected, 1=Ignored.

Register: DIO_INHIBIT

Address: 2900

```
property dio_pulldown_enable: int
```

T8 Only. This register will enable pulldowns on DIO lines. This is a binary coded value where bit 0 represent FIO0, and bit 11 represents EIO3, etc. 1 = pulldown enabled, 0 = pulldown disabled. This register only affects flex-lines which can be configured as analog or digital. This register is not affected by the inhibit register.

Register: DIO_PULLDOWN_ENABLE

Address: 2870

```
property dio_pullup_disable: int
```

This register will prevent pullups from being enabled on lines set to digital input. This is a binary coded value where bit 0 represent FIO0 and bit 11 represents EIO3. 1 = pullup disabled, 0 = pullup enabled. This register is not affected by the inhibit register.

Register: DIO_PULLUP_DISABLE

Address: 2890

```
property dio_state: int
```

Read or write the state of all digital I/O in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. A read of an output returns the current logic level on the terminal, not necessarily the output state written. Writes are filtered by the value in DIO_INHIBIT.

Register: DIO_STATE

Address: 2800

```
property eio0: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO0 (EIO#(0:7)@0)

Address: 2008

```
property eio1: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO1 (EIO#(0:7)@1)

Address: 2009

```
property eio2: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO2 (EIO#(0:7)@2)

Address: 2010

```
property eio3: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO3 (EIO#(0:7)@3)

Address: 2011

```
property eio4: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO4 (EIO#(0:7)@4)

Address: 2012

```
property eio5: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO5 (EIO#(0:7)@5)

Address: 2013

```
property eio6: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO6 (EIO#(0:7)@6)

Address: 2014

```
property eio7: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: EIO7 (EIO#(0:7)@7)

Address: 2015

```
property eio_cio_state: int
```

Read or write the state of the 12 bits of EIO-CIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written. As of firmware 1.0172, MIO states are included in the upper nibble of the CIO byte.

Register: EIO_CIO_STATE

Address: 2581

```
property eio_direction: int
```

Read or write the direction of the 8 bits of EIO in a single binary-encoded value. 0=Input and 1=Output. The upper 8-bits of this value are inhibits.

Register: EIO_DIRECTION

Address: 2601

```
property eio_state: int
```

Read or write the state of the 8 bits of EIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written. The upper 8-bits of this value are inhibits.

Register: EIO_STATE

Address: 2501

```
property ethernet_altdns: str
```

Read the current Alt DNS of wired Ethernet.

Register: ETHERNET_ALTDNS

Address: 49108

```
property ethernet_altdns_default: str
```

The Alt DNS of wired Ethernet after a power-cycle to the device.

Register: ETHERNET_ALTDNS_DEFAULT

Address: 49158

```
property ethernet_apply_settings: int
```

Writing 1 to this register power-cycles Ethernet. It tells the device to waits 1s before turning off Ethernet and then 500ms before turning it back on.

Register: ETHERNET_APPLY_SETTINGS

Address: 49190

```
property ethernet_dhcp_enable: int
```

Read the current Enabled/Disabled state of Ethernet DHCP.

Register: ETHERNET_DHCP_ENABLE

Address: 49110

```
property ethernet_dhcp_enable_default: int
```

The Enabled/Disabled state of Ethernet DHCP after a power-cycle to the device.

Register: ETHERNET_DHCP_ENABLE_DEFAULT

Address: 49160

```
property ethernet_dns: str
```

Read the current DNS of wired Ethernet.

Register: ETHERNET_DNS

Address: 49106

```
property ethernet_dns_default: str
```

The DNS of wired Ethernet after a power-cycle to the device.

Register: ETHERNET_DNS_DEFAULT

Address: 49156

```
property ethernet_gateway: str
```

Read the current gateway of wired Ethernet.

Register: ETHERNET_GATEWAY

Address: 49104

```
property ethernet_gateway_default: str
```

The gateway of wired Ethernet after a power-cycle to the device.

Register: ETHERNET_GATEWAY_DEFAULT

Address: 49154

```
property ethernet_ip: str
```

Read the current IP address of wired Ethernet.

Register: ETHERNET_IP

Address: 49100

```
property ethernet_ip_default: str
```

The IP address of wired Ethernet after a power-cycle to the device.

Register: ETHERNET_IP_DEFAULT

Address: 49150

```
property ethernet_mac: str
```

The MAC address of the wired Ethernet module.

Register: ETHERNET_MAC

Address: 60020

```
property ethernet_subnet: str
```

Read the current subnet of wired Ethernet.

Register: ETHERNET_SUBNET

Address: 49102

```
property ethernet_subnet_default: str
```

The subnet of wired Ethernet after a power-cycle to the device.

Register: ETHERNET_SUBNET_DEFAULT

Address: 49152

```
property ethernet_udp_discovery_only: int
```

Restricts which Modbus operations are allowed over UDP. When set to 1, only the registers needed for discovering units can be read and any other operation will throw an error.

Register: ETHERNET_UDP_DISCOVERY_ONLY

Address: 49115

```
property ethernet_udp_discovery_only_default: int
```

The Enabled/Disabled state of ETHERNET_UDP_DISCOVERY_ONLY after a power-cycle to the device.

Register: ETHERNET_UDP_DISCOVERY_ONLY_DEFAULT

Address: 49165

```
property file_io_attributes: int
```

Used to differentiate files from directories/folders. Bitmask: Bit0: Reserved, Bit1: Reserved, Bit2: Reserved, Bit3: Reserved, Bit4: 1=Directory, Bit5: 1=File.

Register: FILE_IO_ATTRIBUTES

Address: 60623

```
property file_io_close: int
```

Write any value to this register to close the open file.

Register: FILE_IO_CLOSE

Address: 60621

```
property file_io_delete: int
```

Write any value to this register to delete the active file. Must first designate which file to delete by writing to FILE_IO_PATH_WRITE_LEN_BYTES then FILE_IO_PATH_WRITE.

Register: FILE_IO_DELETE

Address: 60622

```
property file_io_dir_change: int
```

Write any value to this register to change the current working directory (CWD). Must first designate which directory to open by writing to FILE_IO_PATH_WRITE_LEN_BYTES then FILE_IO_PATH_WRITE.

Register: FILE_IO_DIR_CHANGE

Address: 60600

```
property file_io_dir_current: int
```

Write any value to this register to load the current working directory into FILE_IO_PATH_READ, and its length into FILE_IO_PATH_READ_LEN_BYTES. Can be used to identify current position in a file tree.

Register: FILE_IO_DIR_CURRENT

Address: 60601

```
property file_io_dir_first: int
```

Write any value to this register to initiate iteration through files and directories in the CWD. Typical sequence: FILE_IO_DIR_FIRST(W), then loop through: [FILE_IO_NAME_READ_LEN(R), FILE_IO_NAME_READ(R), FILE_IO_ATTRIBUTES(R), FILE_IO_SIZE_BYTES(R), FILE_IO_DIR_NEXT(W)] ..until any of the following errors: FILE_IO_END_OF_CWD (2966), FILE_IO_INVALID_OBJECT (2809), or FILE_IO_NOT_FOUND (2960).

Register: FILE_IO_DIR_FIRST

Address: 60610

```
property file_io_dir_make: int
```

Unimplemented.

Register: FILE_IO_DIR_MAKE

Address: 60602

```
property file_io_dir_next: int
```

Write any value to this register to continue iteration through files and directories in the CWD.

Register: FILE_IO_DIR_NEXT

Address: 60611

```
property file_io_dir_remove: int
```

Unimplemented.

Register: FILE_IO_DIR_REMOVE

Address: 60603

```
property file_io_disk_format_index: int
```

Used to determine the format of the SD card. 0=None or Unknown, 1=FAT12, 2=FAT16(Windows FAT), 3=FAT32.

Register: FILE_IO_DISK_FORMAT_INDEX

Address: 60638

```
property file_io_disk_free_clusters: int
```

Free (available) clusters in the SD card. Used to determine free space. Captured on read of FILE_IO_DISK_SECTOR_SIZE_BYTES.

Register: FILE_IO_DISK_FREE_CLUSTERS

Address: 60636

```
property file_io_disk_sector_size_bytes: int
```

The size of each sector in the SD card in bytes. In Windows this is called the Allocation Size.

Register: FILE_IO_DISK_SECTOR_SIZE_BYTES

Address: 60630

```
property file_io_disk_sectors_per_cluster: int
```

The number of sectors in each cluster. Captured on read of FILE_IO_DISK_SECTOR_SIZE_BYTES.

Register: FILE_IO_DISK_SECTORS_PER_CLUSTER

Address: 60632

```
property file_io_disk_total_clusters: int
```

The total number of clusters in the SD card. Captured on read of FILE_IO_DISK_SECTOR_SIZE_BYTES.

Register: FILE_IO_DISK_TOTAL_CLUSTERS

Address: 60634

```
property file_io_open: int
```

Write any value to this register to open a file. Must first designate which file to open by writing to FILE_IO_PATH_WRITE_LEN_BYTES then FILE_IO_PATH_WRITE.

Register: FILE_IO_OPEN

Address: 60620

```
property file_io_path_read: int
```

Read the next file path in the CWD. Length of the string (in bytes) determined by FILE_IO_PATH_READ_LEN_BYTES. File paths will be null terminated.

This register is a buffer. Underrun behavior - fill with zeros.

Register: FILE_IO_PATH_READ

Address: 60652

```
property file_io_path_read_len_bytes: int
```

Read the length (in bytes) of the next file path or directory to access.

Register: FILE_IO_PATH_READ_LEN_BYTES

Address: 60642

```
property file_io_path_write: int
```

Write the desired file path. Must first write the length of the file path string (in bytes) to FILE_IO_PATH_WRITE_LEN_BYTES. File paths should be null terminated. This register is a buffer.

Register: FILE_IO_PATH_WRITE

Address: 60650

```
property file_io_path_write_len_bytes: int
```

Write the length (in bytes) of the file path or directory to access.

Register: FILE_IO_PATH_WRITE_LEN_BYTES

Address: 60640

```
property file_io_read: int
```

Read the contents of a file. Must first write to FILE_IO_OPEN. Size of the file (in bytes) determined by FILE_IO_SIZE_BYTES.

This register is a buffer. Underrun behavior - throws an error.

Register: FILE_IO_READ

Address: 60656

```
property file_io_size_bytes: int
```

The size of the file in bytes. Directories have 0 size.

Register: FILE_IO_SIZE_BYTES

Address: 60628

```
property file_io_write: int
```

Unimplemented. This register is a buffer.

Register: FILE_IO_WRITE

Address: 60654

```
property fio0: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO0 (FIO#(0:7)@0)

Address: 2000

```
property fio1: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO1 (FIO#(0:7)@1)

Address: 2001

```
property fio2: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO2 (FIO#(0:7)@2)

Address: 2002

```
property fio3: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO3 (FIO#(0:7)@3)

Address: 2003

```
property fio4: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO4 (FIO#(0:7)@4)

Address: 2004

```
property fio5: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO5 (FIO#(0:7)@5)

Address: 2005

```
property fio6: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO6 (FIO#(0:7)@6)

Address: 2006

```
property fio7: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: FIO7 (FIO#(0:7)@7)

Address: 2007

```
property fio_direction: int
```

Read or write the direction of the 8 bits of FIO in a single binary-encoded value. 0=Input and 1=Output. The upper 8-bits of this value are inhibits.

Register: FIO_DIRECTION

Address: 2600

```
property fio_eio_state: int
```

Read or write the state of the 16 bits of FIO-EIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written.

Register: FIO_EIO_STATE

Address: 2580

```
property fio_state: int
```

Read or write the state of the 8 bits of FIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written. The upper 8-bits of this value are inhibits.

Register: FIO_STATE

Address: 2500

```
property firmware_version: float
```

The current firmware version installed on the main processor.

Register: FIRMWARE_VERSION

Address: 60004

```
property hardware_installed: int
```

Bitmask indicating installed hardware options. bit0: High Resolution ADC, bit1: WiFi, bit2: RTC, bit3: microSD.

Register: HARDWARE_INSTALLED

Address: 60010

```
property hardware_version: float
```

The hardware version of the device.

Register: HARDWARE_VERSION

Address: 60002

```
property i2c_acks: int
```

A binary encoded value (array of bits) used to observe ACKs from the slave device.

Register: I2C_ACKS

Address: 5114

```
property i2c_data_rx: int
```

Data that has been read from the I2C bus.

This register is a buffer. Underrun behavior - fill with zeros.

Register: I2C_DATA_RX

Address: 5160

```
property i2c_data_tx: int
```

Data that will be written to the I2C bus. This register is a buffer.

Register: I2C_DATA_TX

Address: 5120

```
property i2c_go: int
```

Writing to this register will instruct the LabJack to perform an I2C transaction.

Register: I2C_GO

Address: 5110

```
property i2c_num_bytes_rx: int
```

The number of data bytes to read. Zero is valid and will result in a write-only I2C operation.

Register: I2C_NUM_BYTES_RX

Address: 5109

```
property i2c_num_bytes_tx: int
```

The number of data bytes to transmit. Zero is valid and will result in a read-only I2C operation.

Register: I2C_NUM_BYTES_TX

Address: 5108

```
property i2c_options: int
```

Advanced. Controls details of the I2C protocol to improve device compatibility. bit 0: 1 = Reset the I2C bus before attempting communication. bit 1: 0 = Restarts will use a stop and a start, 1 = Restarts will not use a stop. bit 2: 1 = disable clock stretching.

Register: I2C_OPTIONS

Address: 5103

```
property i2c_scl_dionum: int
```

The number of the DIO line to be used as the I2C clock line. Ex: Writing 1 will force FIO1 to become the I2C-SCL line.

Register: I2C_SCL_DIONUM

Address: 5101

```
property i2c_sda_dionum: int
```

The number of the DIO line to be used as the I2C data line. Ex: Writing 0 will force FIO0 to become the I2C-SDA line.

Register: I2C_SDA_DIONUM

Address: 5100

```
property i2c_slave_address: int
```

The 7-bit address of the slave device. Value is shifted left by firmware to allow room for the I2C R/W bit.

Register: I2C_SLAVE_ADDRESS

Address: 5104

```
property i2c_speed_throttle: int
```

This value controls the I2C clock frequency. Pass 0-65535. Default=0 corresponds to 65536 internally which results in ~450 kHz. 1 results in ~40 Hz, 65516 is ~100 kHz.

Register: I2C_SPEED_THROTTLE

Address: 5102

```
property internal_flash_calculate_crc: int
```

Calculates the checksum of a 4096 byte flash page.

Register: INTERNAL_FLASH_CALCULATE_CRC

Address: 61842

```
property internal_flash_erase: int
```

Erases a 4k section of internal flash starting at the specified address. This register is a buffer.

Register: INTERNAL_FLASH_ERASE

Address: 61820

```
property internal_flash_key: int
```

Sets the region of internal flash to which access is allowed.

Register: INTERNAL_FLASH_KEY

Address: 61800

```
property internal_flash_read: int
```

Data read from internal flash. Read size must be an even number of registers.

Register: INTERNAL_FLASH_READ

Address: 61812

```
property internal_flash_read_pointer: int
```

The address in internal flash that reads will start from.

Register: INTERNAL_FLASH_READ_POINTER

Address: 61810

```
property internal_flash_write: int
```

Data written here will be written to internal flash. Write size must be an even number of registers. This register is a buffer.

Register: INTERNAL_FLASH_WRITE

Address: 61832

```
property internal_flash_write_pointer: int
```

Address in internal flash where writes will begin.

Register: INTERNAL_FLASH_WRITE_POINTER

Address: 61830

```
property internal_is_amps: float
```

T8 Only. Returns the power supply current draw.

Register: INTERNAL_IS_AMPS

Address: 60032

```
property internal_vs_volts: float
```

T8 Only. Returns the power supply voltage.

Register: INTERNAL_VS_VOLTS

Address: 60030

```
property io_config_check_for_default: int
```

Returns 1 if the current configuration matches the default configuration.

Register: IO_CONFIG_CHECK_FOR_DEFAULT

Address: 49018

```
property io_config_check_for_factory: int
```

Returns 1 if default settings are the same as factory settings.

Register: IO_CONFIG_CHECK_FOR_FACTORY

Address: 49000

```
property io_config_current_crc32: int
```

Collects the current IO configuration and calculates of a CRC32.

Register: IO_CONFIG_CURRENT_CRC32

Address: 49020

```
property io_config_current_pread: int
```

The address in the current configuration data which reads will start from.

Register: IO_CONFIG_CURRENT_pREAD

Address: 49014

```
property io_config_current_read: int
```

Data read from the current configuration.

Register: IO_CONFIG_CURRENT_READ

Address: 49016

```
property io_config_default_pread: int
```

The address in the configuration data which reads will start from.

Register: IO_CONFIG_DEFAULT_pREAD

Address: 49010

```
property io_config_default_read: int
```

Data read from the startup configuration.

Register: IO_CONFIG_DEFAULT_READ

Address: 49012

```
property io_config_factory_pread: int
```

The address in the factory configuration data which reads will start from.

Register: IO_CONFIG_FACTORY_pREAD

Address: 49006

```
property io_config_factory_read: int
```

Data read from factory configuration.

Register: IO_CONFIG_FACTORY_READ

Address: 49008

```
property io_config_set_current_to_default: int
```

Write a 1 to set current values to default configuration. The default values are retrieved from flash and written to the current configuration registers, thus this behaves similar to reboot/power-up. Systems affected: AIN, DIO, DAC, AIN_EF, DIO_EF.

Register: IO_CONFIG_SET_CURRENT_TO_DEFAULT

Address: 61991

```
property io_config_set_current_to_factory: int
```

Write a 1 to set current values to factory configuration. The factory values are retrieved from flash and written to the current configuration registers. Systems affected: AIN, DIO, DAC, AIN_EF, DIO_EF.

Register: IO_CONFIG_SET_CURRENT_TO_FACTORY

Address: 61990

```
property io_config_set_default_to_current: int
```

Write a 1 to cause new default (reboot/power-up) values to be saved to flash. Current values are retrieved and saved as the new defaults. Systems affected: AIN, DIO, DAC, AIN_EF, DIO_EF.

Register: IO_CONFIG_SET_DEFAULT_TO_CURRENT

Address: 49002

```
property io_config_set_default_to_factory: int
```

Write a 1 to cause new default (reboot/power-up) values to be saved to flash. Factory values are retrieved and saved as the new defaults. Systems affected: AIN, DIO, DAC, AIN_EF, DIO_EF.

Register: IO_CONFIG_SET_DEFAULT_TO_FACTORY

Address: 49004

```
property last_err_detail: int
```

Returns the last LabJack error code seen on the device.

Register: LAST_ERR_DETAIL

Address: 55000

```
property last_err_frame: int
```

Returns the frame number that caused the last error.

Register: LAST_ERR_FRAME

Address: 55002

```
property last_err_transaction_id: int
```

Returns the transaction ID of the Modbus TCP packet that caused the last error.

Register: LAST_ERR_TRANSACTION_ID

Address: 55003

```
property last_mb_err: int
```

Returns the last Modbus TCP error code seen on the device.

Register: LAST_MB_ERR

Address: 55001

```
property led_comm: int
```

Sets the state of the COMM LED when the LEDs are set to manual, see the POWER_LED register.

Register: LED_COMM

Address: 2990

```
property led_status: int
```

Sets the state of the STATUS LED when the LEDs are set to manual, see the POWER_LED register.

Register: LED_STATUS

Address: 2991

```
property ljmcommon_version: float
```

The MAC address of the wired Ethernet module.

Register: LJMCOMMON_VERSION

Address: 60018

```
property lua_debug_data: int
```

Read debug data from here. This register is a buffer.

Register: LUA_DEBUG_DATA

Address: 6024

```
property lua_debug_enable: int
```

Write 1 to this register to enable debugging.

Register: LUA_DEBUG_ENABLE

Address: 6020

```
property lua_debug_enable_default: int
```

This is the value that will be loaded into LUA_DEBUG_ENABLE when the LabJack boots up.

Register: LUA_DEBUG_ENABLE_DEFAULT

Address: 6120

```
property lua_debug_num_bytes: int
```

The number of data bytes in the debug buffer waiting to be read.

Register: LUA_DEBUG_NUM_BYTES

Address: 6022

```
property lua_debug_num_bytes_default: int
```

This is the number of bytes that will be used for the lua debug buffer.

Register: LUA_DEBUG_NUM_BYTES_DEFAULT

Address: 6122

```
property lua_load_saved: int
```

Writing any value reads the script from Flash and loads it into RAM. The script can now be compiled and run.

Register: LUA_LOAD_SAVED

Address: 6034

```
property lua_no_warn_truncation: int
```

Writing a 1 to this register will prevent truncation warnings from being displayed. This register will be cleared every time Lua is started.

Register: LUA_NO_WARN_TRUNCATION

Address: 6050

```
property lua_run: int
```

Writing 1 compiles and runs the Lua script that is loaded in RAM. Writing zero stops the script and begins cleaning up memory. Users may poll the register after writing a value of 0 to verify that the VM is unloaded, and garbage collection is complete. 0 = VM fully unloaded. 1 = Running/in-progress.

Register: LUA_RUN

Address: 6000

```
property lua_run_default: int
```

If set to 1 the script saved in flash will be loaded and run when the LabJack boots up.

Register: LUA_RUN_DEFAULT

Address: 6100

```
property lua_save_to_flash: int
```

Write 1 to save the loaded source code to flash.

Register: LUA_SAVE_TO_FLASH

Address: 6032

```
property lua_saved_read: int
```

Read script saved to flash from here.

Register: LUA_SAVED_READ

Address: 6038

```
property lua_saved_read_pointer: int
```

Address within the saved Lua script in Flash to begin reading from.

Register: LUA_SAVED_READ_POINTER

Address: 6036

```
property lua_source_size: int
```

Allocates RAM for the source code.

Register: LUA_SOURCE_SIZE

Address: 6012

```
property lua_source_write: int
```

Write the source code here. Source will be saved to the RAM allocated by LUA_SOURCE_SIZE. This register is a buffer.

Register: LUA_SOURCE_WRITE

Address: 6014

```
property mio0: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: MIO0 (MIO#(0:2)@0)

Address: 2020

```
property mio1: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: MIO1 (MIO#(0:2)@1)

Address: 2021

```
property mio2: int
```

Read or set the state of 1 bit of digital I/O. Also configures the direction to input or output. Read 0=Low AND 1=High. Write 0=Low AND 1=High.

Register: MIO2 (MIO#(0:2)@2)

Address: 2022

```
property mio_direction: int
```

Read or write the direction of the 3 bits of MIO in a single binary-encoded value. 0=Input and 1=Output. The upper 8-bits of this value are inhibits.

Register: MIO_DIRECTION

Address: 2603

```
property mio_state: int
```

Read or write the state of the 3 bits of MIO in a single binary-encoded value. 0=Low AND 1=High. Does not configure direction. Reading lines set to output returns the current logic levels on the terminals, not necessarily the output states written. The upper 8-bits of this value are inhibits.

Register: MIO_STATE

Address: 2503

```
property onewire_data_rx: int
```

Data received over the 1-wire bus.

This register is a buffer. Underrun behavior - buffer is static, old data will fill the extra locations, firmware 1.0225 changes this to read zeros.

Register: ONEWIRE_DATA_RX

Address: 5370

```
property onewire_data_tx: int
```

Data to be transmitted over the 1-wire bus. This register is a buffer.

Register: ONEWIRE_DATA_TX

Address: 5340

```
property onewire_dpu_dionum: int
```

The dynamic pullup control DIO number.

Register: ONEWIRE_DPU_DIONUM

Address: 5301

```
property onewire_dq_dionum: int
```

The data-line DIO number.

Register: ONEWIRE_DQ_DIONUM

Address: 5300

```
property onewire_function: int
```

Set the ROM function to use. 0xF0=Search, 0xCC=Skip, 0x55=Match, 0x33=Read.

Register: ONEWIRE_FUNCTION

Address: 5307

```
property onewire_go: int
```

Instructs the device to perform the configured 1-wire transaction.

Register: ONEWIRE_GO

Address: 5310

```
property onewire_num_bytes_rx: int
```

Number of data bytes to be received.

Register: ONEWIRE_NUM_BYTES_RX

Address: 5309

```
property onewire_num_bytes_tx: int
```

Number of data bytes to be sent.

Register: ONEWIRE_NUM_BYTES_TX

Address: 5308

```
property onewire_options: int
```

Controls advanced features. Value is a bitmask. bit 0: reserved, bit 1: reserved, bit 2: 1=DPU Enabled 0=DPU Disabled, bit 3: DPU Polarity 1=Active state is high, 0=Active state is low (Dynamic Pull-Up)

Register: ONEWIRE_OPTIONS

Address: 5302

```
property onewire_path_h: int
```

Upper 32-bits of the path to take during a search.

Register: ONEWIRE_PATH_H

Address: 5324

```
property onewire_path_l: int
```

Lower 32-bits of the path to take during a search.

Register: ONEWIRE_PATH_L

Address: 5326

```
property onewire_rom_branchs_found_h: int
```

Upper 32-bits of the branches detected during a search.

Register: ONEWIRE_ROM_BRANCHS_FOUND_H

Address: 5332

```
property onewire_rom_branchs_found_l: int
```

Lower 32-bits of the branches detected during a search.

Register: ONEWIRE_ROM_BRANCHS_FOUND_L

Address: 5334

```
property onewire_rom_match_h: int
```

Upper 32-bits of the ROM to match.

Register: ONEWIRE_ROM_MATCH_H

Address: 5320

```
property onewire_rom_match_l: int
```

Lower 32-bits of the ROM to match.

Register: ONEWIRE_ROM_MATCH_L

Address: 5322

```
property onewire_search_result_h: int
```

Upper 32-bits of the search result.

Register: ONEWIRE_SEARCH_RESULT_H

Address: 5328

```
property onewire_search_result_l: int
```

Lower 32-bites of the search result.

Register: ONEWIRE_SEARCH_RESULT_L

Address: 5330

```
property power_ain: int
```

The current ON/OFF state of the analog input module.

Register: POWER_AIN

Address: 48005

```
property power_ain_default: int
```

The ON/OFF state of the analog input module after a power-cycle to the device. Provided to optionally reduce power consumption.

Register: POWER_AIN_DEFAULT

Address: 48055

```
property power_ethernet: int
```

The current ON/OFF state of the Ethernet module.

Register: POWER_ETHERNET

Address: 48003

```
property power_ethernet_default: int
```

The ON/OFF state of the Ethernet module after a power-cycle to the device. Provided to optionally reduce power consumption.

Register: POWER_ETHERNET_DEFAULT

Address: 48053

```
property power_led: int
```

Sets the LED operation: 0 = Off. Useful for lower power applications. 1 = normal. 2 = Lower power, LEDs will still blink but will normally be off. 3 = Reserved. 4 = Manual, in this mode the LEDs can be user controlled.

Register: POWER_LED

Address: 48006

```
property power_led_default: int
```

The ON/OFF state of the LEDs after a power-cycle to the device.

Register: POWER_LED_DEFAULT

Address: 48056

```
property power_wifi: int
```

The current ON/OFF state of the WiFi module.

Register: POWER_WIFI

Address: 48004

```
property power_wifi_default: int
```

The ON/OFF state of the WiFi module after a power-cycle to the device. Provided to optionally reduce power consumption.

Register: POWER_WIFI_DEFAULT

Address: 48054

```
property product_id: float
```

The numeric identifier of the device. Such as 7 for a T7 / T7-Pro.

Register: PRODUCT_ID

Address: 60000

```
property rtc_set_time_s: int
```

Write a new timestamp to the RTC in seconds since Jan, 1970, aka Epoch or Unix timestamp.

Register: RTC_SET_TIME_S

Address: 61504

```
property rtc_set_time_sntp: int
```

Write any value to instruct the T7 to update its clock from a SNTP server. Requires that SNTP_UPDATE_INTERVAL is non-zero.

Register: RTC_SET_TIME_SNTP

Address: 61506

```
property rtc_time_calendar: int
```

Read six consecutive addresses of type UINT16, starting with this address. The result will be in year, month, day, hour, minute, second calendar format. i.e. [2014, 10, 21, 18, 55, 35]

Register: RTC_TIME_CALENDAR

Address: 61510

```
property rtc_time_s: int
```

Read the current time in seconds since Jan, 1970, aka Epoch or Unix time. This value is calculated from the 80 MHz crystal, not the RTC 32 kHz crystal. Non-pro devices do not have a real time clock, so the reported time is either seconds since device startup or the time reported by the network time protocol over Ethernet. Pro devices have a real time clock that will be used to initialize this register at startup, the time can then be updated by NTP.

Register: RTC_TIME_S

Address: 61500

```
property sbus0_background_enable: int
```

Currently unsupported.

```

Currently unsupported.

Register: SBUS9_BACKGROUND_ENABLE (SBUS#(0:22)_BACKGROUND_ENABLE@9)

Address: 30259

```
property sbus9_clock_dionum: int
```

This is the DIO# that the external sensor's clock line is connected to.

Register: SBUS9_CLOCK_DIONUM (SBUS#(0:22)_CLOCK_DIONUM@9)

Address: 30234

```
property sbus9_data_dionum: int
```

This is the DIO# that the external sensor's data line is connected to.

Register: SBUS9_DATA_DIONUM (SBUS#(0:22)_DATA_DIONUM@9)

Address: 30209

```
property sbus9_rh: float
```

Reads humidity in % from an external SBUS sensor (EI-1050/SHT1x/SHT7x). # is the DIO line for the EI-1050 enable. If # is the same as the value specified for data or clock line, there will be no control of an enable line.

Register: SBUS9_RH (SBUS#(0:22)_RH@9)

Address: 30168

```
property sbus9_temp: float
```

Reads temperature in Kelvin from an SBUS sensor (EI-1050/SHT1x/SHT7x). SBUS# is the DIO line for the EI-1050 enable. If SBUS# is the same as the value specified for data or clock line, there will be no control of an enable line.

Register: SBUS9_TEMP (SBUS#(0:22)_TEMP@9)

Address: 30118

```
property sbus_all_clock_dionum: int
```

A write to this global parameter sets all SBUS clock line registers to the same value. A read will return the correct setting if all channels are set the same, but otherwise will return 0xFF.

Register: SBUS_ALL_CLOCK_DIONUM

Address: 30276

```
property sbus_all_clock_speed: int
```

Sets the clock speed. The clock is software generated so the resulting frequency is not exact. Valid range is 0-65535. Larger values are faster. 0 is the fastest option and is equivalent to 65536. A value of 0 is ~200 kHz. A value of 65000 is ~9.1 kHz.

Register: SBUS_ALL_CLOCK_SPEED

Address: 30278

```
property sbus_all_data_dionum: int
```

A write to this global parameter sets all SBUS data line registers to the same value. A read will return the correct setting if all channels are set the same, but otherwise will return 0xFF.

Register: SBUS_ALL_DATA_DIONUM

Address: 30275

```
property sbus_all_power_dionum: int
```

Sets the power line. This DIO is set to output-high upon any read of SBUS#_TEMP or SBUS#_RH. Default is FIO6 for the T4 and FIO2 for the T7. An FIO line can power up to 4 sensors while an EIO/CIO/MIO line or DAC line can power up to 20 sensors. Set to 9999 to disable. To use multiple power lines, use a DAC line for power, or otherwise control power yourself, set this to 9999 and then control power using writes to normal registers such as FIO5, EIO0, or DAC0.

Register: SBUS_ALL_POWER_DIONUM

Address: 30277

```
property serial_number: int
```

The serial number of the device.

Register: SERIAL_NUMBER

Address: 60028

```
setup_ain0(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN0.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain1(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN1.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain2(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN2.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain3(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN3.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain4(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN4.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain5(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN5.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain6(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN6.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain7(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0) →
None
```

Setup AIN7.

Parameters:

- **range** – the maximum expected voltage to automatically select the best gain
- **settling_time_us** – the settling time in micro seconds
- **resolution_index** – see LabJack docs

```
setup_ain_all(range_: float = 0.0, settling_time_us: int = 0, resolution_index: int = 0)
→ None
```

Setup all AIN channels.

```
property sntp_update_interval: int
```

Sets the SNTP retry time in seconds. A value of zero will disable SNTP(0=default). Values must be 10 or greater.

Register: SNTP_UPDATE_INTERVAL

Address: 49702

```
property spc_frequency_out_enable_deprecated: int
```

This has been deprecated in favor of DAC1_FREQUENCY_OUT_ENABLE. 0 = off, 1 = output 10 Hz signal on SPC. Note that stream uses SPC for a timing output, so if you use this while streaming you will get a lot more counts.

Register: SPC_FREQUENCY_OUT_ENABLE_DEPRECATED

Address: 61530

```
property spi_clk_dionum: int
```

The DIO line for Clock.

Register: SPI_CLK_DIONUM

Address: 5001

```
property spi_cs_dionum: int
```

The DIO line for Chip-Select.

Register: SPI_CS_DIONUM

Address: 5000

```
property spi_data_rx: int
```

Read data here.

This register is a buffer. Underrun behavior - fill with zeros.

Register: SPI_DATA_RX

Address: 5050

```
property spi_data_tx: int
```

Write data here. This register is a buffer.

Register: SPI_DATA_TX

Address: 5010

```
property spi_go: int
```

Write 1 to begin the configured SPI transaction.

Register: SPI_GO

Address: 5007

```
property spi_miso_dionum: int
```

The DIO line for Master-In-Slave-Out.

Register: SPI_MISO_DIONUM

Address: 5002

```
property spi_mode: int
```

The SPI mode controls the clock idle state and which edge clocks the data. Bit 1 is CPOL and Bit 0 is CPHA, so CPOL/CPHA for different decimal values: 0 = 0/0 = b00, 1 = 0/1 = b01, 2 = 1/0 = b10, 3 = 1/1 = b11. For CPOL and CPHA explanations, see Wikipedia article: https://en.wikipedia.org/wiki/Serial_Peripheral_Interface_Bus.

Register: SPI_MODE

Address: 5004

```
property spi_mosi_dionum: int
```

The DIO line for Master-Out-Slave-In.

Register: SPI_MOSI_DIONUM

Address: 5003

```
property spi_num_bytes: int
```

The number of bytes to transfer. The maximum transfer size is 100 bytes.

Register: SPI_NUM_BYTES

Address: 5009

```
property spi_options: int
```

Bit 0 is Auto-CS-Disable. When bit 0 is 0, CS is enabled. When bit 0 is 1, CS is disabled. Bit 1: 0 = Set DIO directions before starting the SPI operations, 1 = Do not set DIO directions. Bit 2: 0 = Transmit data MSB first, 1 = LSB first. Bits 4-7: This value sets the number of bits that will be transmitted during the last byte of the SPI operation. Default is 8, valid options are 1-8.

Register: SPI_OPTIONS

Address: 5006

```
property spi_speed_throttle: int
```

This value controls the SPI clock frequency. Pass 0-65535. Default=0 corresponds to 65536 internally which results in ~800 kHz. 65500 = ~100 kHz, 65100 = ~10 kHz, 61100 = ~1 kHz, 21000 = ~100 Hz, and 1 = ~67 Hz. Avoid setting too low such that the entire transaction lasts longer than the 250 millisecond timeout of the internal watchdog timer.

Register: SPI_SPEED_THROTTLE

Address: 5005

```
property stream_auto_target: int
```

Controls where data will be sent. Value is a bitmask. bit 0: 1 = Send to Ethernet 702 sockets, bit 1: 1 = Send to USB, bit 4: 1 = Command-Response mode. All other bits are reserved.

Register: STREAM_AUTO_TARGET

Address: 4016

```
property stream_autorecover_disable: int
```

When the stream buffer becomes full the stream will be stopped. Same behavior as if STREAM_ENABLE is set to zero.

Register: STREAM_AUTORECOVER_DISABLE

Address: 4028

```
property stream_buffer_size_bytes: int
```

Size of the stream data buffer in bytes. A value of 0 equates to the default value. Must be a power of 2. Size in samples is STREAM_BUFFER_SIZE_BYTES/2. Size in scans is (STREAM_BUFFER_SIZE_BYTES/2)/STREAM_NUM_ADDRESSES. Changes while stream is running do not affect the currently running stream.

Register: STREAM_BUFFER_SIZE_BYTES

Address: 4012

```
property stream_clock_source: int
```

Controls which clock source will be used to run the main stream clock. 0 = Internal crystal, 2 = External clock source on CIO3. Rising edges will increment a counter and trigger a stream scan after the number of edges specified in STREAM_EXTERNAL_CLOCK_DIVISOR. T7 will expect external stream clock on CIO3. All other values reserved.

Register: STREAM_CLOCK_SOURCE

Address: 4014

```
property stream_data_capture_16: int
```

If a channel produces 32-bits of data the upper 16 will be saved here.

Register: STREAM_DATA_CAPTURE_16

Address: 4899

```
property stream_data_cr: int
```

Address to read stream data from when operating in C-R mode.

Register: STREAM_DATA_CR

Address: 4500

```
property stream_debug_get_self_index: int
```

Returns the index of the channel. The index is the position in the scan list that the channel occupies.

Register: STREAM_DEBUG_GET_SELF_INDEX

Address: 4898

```
property stream_enable: int
```

Write 1 to start stream. Write 0 to stop stream. Reading this register returns 1 when stream is enabled. When using a triggered stream the stream is considered enabled while waiting for the trigger.

Register: STREAM_ENABLE

Address: 4990

```
property stream_external_clock_divisor: int
```

The number of pulses per stream scan when using an external clock.

Register: STREAM_EXTERNAL_CLOCK_DIVISOR

Address: 4022

```
property stream_num_addresses: int
```

The number of entries in the scanlist.

Register: STREAM_NUM_ADDRESSES

Address: 4004

```
property stream_num_scans: int
```

The number of scans to run before automatically stopping (stream-burst). 0 = run continuously. Limit for STREAM_NUM_SCANS is 2^32-1, but if the host is not reading data as fast as it is acquired you also need to consider STREAM_BUFFER_SIZE_BYTES.

Register: STREAM_NUM_SCANS

Address: 4020

```
property stream_out0: int
```

127) to trigger stream-out updates. When added to the scan list these do count against the max scan rate just like normal input addresses, but they do not return any data in the stream read.

Register: STREAM_OUT0 (STREAM_OUT#(0:3)@0)

Address: 4800

Type:
Include one or more of these registers in STREAM_SCANLIST_ADDRESS#(0

```
property stream_out0_buffer_allocate_num_bytes: int
```

Size of the buffer in bytes as a power of 2. Should be at least twice the size of updates that will be written and no less than 32. The usable buffer size will be equal to the value of this register minus 2 bytes (one 16-bit sample). Before writing data to _BUFFER_###, you must write to _BUFFER_ALLOCATE_NUM_BYTES to allocate RAM for the data. Max is 16384.

Register: STREAM_OUT0_BUFFER_ALLOCATE_NUM_BYTES (STREAM_OUT#(0:3)_BUFFER_ALLOCATE_NUM_BYTES@0)

Address: 4050

```
property stream_out0_buffer_f32: float
```

Data destination when sending floating point data. Appropriate cal constants are used to convert F32 values to 16-bit binary data, and thus each of these values uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT0_BUFFER_F32 (STREAM_OUT#(0:3)_BUFFER_F32@0)

Address: 4400

```
property stream_out0_buffer_status: int
```

The number of values in the buffer that are not currently being used.

Register: STREAM_OUT0_BUFFER_STATUS (STREAM_OUT#(0:3)_BUFFER_STATUS@0)

Address: 4080

```
property stream_out0_buffer_u16: int
```

Data destination when sending 16-bit integer data. Each value uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT0_BUFFER_U16 (STREAM_OUT#(0:3)_BUFFER_U16@0)

Address: 4420

```
property stream_out0_buffer_u32: int
```

Not used at this time. There are no U32 registers supported in stream-out. This register is a buffer.

Register: STREAM_OUT0_BUFFER_U32 (STREAM_OUT#(0:3)_BUFFER_U32@0)

Address: 4410

```
property stream_out0_enable: int
```

When STREAM_OUT#_ENABLE is enabled, the stream out target is generally updated by one value from the stream out buffer per stream scan. For example, there will generally be one instance of e.g. STREAM_OUT0 in the stream scan list, which will cause one STREAM_OUT0_BUFFER value to be consumed and written to STREAM_OUT0_TARGET for every stream scan. The stream scan list could also contain two instances of STREAM_OUT0, in which case two values from STREAM_OUT0_BUFFER value would be consumed and written for every stream scan.

Register: STREAM_OUT0_ENABLE (STREAM_OUT#(0:3)_ENABLE@0)

Address: 4090

```
property stream_out0_loop_num_values: int
```

The number of values, from the end of the array, that will be repeated after reaching the end of supplied data array.

Register: STREAM_OUT0_LOOP_NUM_VALUES (STREAM_OUT#(0:3)_LOOP_NUM_VALUES@0)

Address: 4060

```
property stream_out0_set_loop: int
```

Controls when new data and loop size are used. 1=Use new data immediately. 2=Wait for synch. New data will not be used until a different stream-out channel is set to Synch. 3=Synch. This stream-out# as well as any stream-outs set to synch will start using new data immediately.

Register: STREAM_OUT0_SET_LOOP (STREAM_OUT#(0:3)_SET_LOOP@0)

Address: 4070

```
property stream_out0_target: int
```

Channel that data will be written to. Before writing data to _BUFFER_###, you must write to _TARGET so the device knows how to interpret and store values.

Register: STREAM_OUT0_TARGET (STREAM_OUT#(0:3)_TARGET@0)

Address: 4040

```
property stream_out1: int
```

127) to trigger stream-out updates. When added to the scan list these do count against the max scan rate just like normal input addresses, but they do not return any data in the stream read.

Register: STREAM_OUT1 (STREAM_OUT#(0:3)@1)

Address: 4801

Type:
Include one or more of these registers in STREAM_SCANLIST_ADDRESS#(0

```
property stream_out1_buffer_allocate_num_bytes: int
```

Size of the buffer in bytes as a power of 2. Should be at least twice the size of updates that will be written and no less than 32. The usable buffer size will be equal to the value of this register minus 2 bytes (one 16-bit sample). Before writing data to _BUFFER_###, you must write to _BUFFER_ALLOCATE_NUM_BYTES to allocate RAM for the data. Max is 16384.

Register: STREAM_OUT1_BUFFER_ALLOCATE_NUM_BYTES (STREAM_OUT#(0:3)_BUFFER_ALLOCATE_NUM_BYTES@1)

Address: 4052

```
property stream_out1_buffer_f32: float
```

Data destination when sending floating point data. Appropriate cal constants are used to convert F32 values to 16-bit binary data, and thus each of these values uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT1_BUFFER_F32 (STREAM_OUT#(0:3)_BUFFER_F32@1)

Address: 4402

```
property stream_out1_buffer_status: int
```

The number of values in the buffer that are not currently being used.

Register: STREAM_OUT1_BUFFER_STATUS (STREAM_OUT#(0:3)_BUFFER_STATUS@1)

Address: 4082

```
property stream_out1_buffer_u16: int
```

Data destination when sending 16-bit integer data. Each value uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT1_BUFFER_U16 (STREAM_OUT#(0:3)_BUFFER_U16@1)

Address: 4421

```
property stream_out1_buffer_u32: int
```

Not used at this time. There are no U32 registers supported in stream-out. This register is a buffer.

Register: STREAM_OUT1_BUFFER_U32 (STREAM_OUT#(0:3)_BUFFER_U32@1)

Address: 4412

```
property stream_out1_enable: int
```

When STREAM_OUT#_ENABLE is enabled, the stream out target is generally updated by one value from the stream out buffer per stream scan. For example, there will generally be one instance of e.g. STREAM_OUT0 in the stream scan list, which will cause one STREAM_OUT0_BUFFER value to be consumed and written to STREAM_OUT0_TARGET for every stream scan. The stream scan list could also contain two instances of STREAM_OUT0, in which case two values from STREAM_OUT0_BUFFER value would be consumed and written for every stream scan.

property stream_out2_buffer_allocate_num_bytes: int
```

Size of the buffer in bytes as a power of 2. Should be at least twice the size of updates that will be written and no less than 32. The usable buffer size will be equal to the value of this register minus 2 bytes (one 16-bit sample). Before writing data to _BUFFER_###, you must write to _BUFFER_ALLOCATE_NUM_BYTES to allocate RAM for the data. Max is 16384.

Register: STREAM_OUT2_BUFFER_ALLOCATE_NUM_BYTES
(STREAM_OUT#(0:3)_BUFFER_ALLOCATE_NUM_BYTES@2)

Address: 4054

```
property stream_out2_buffer_f32: float
```

Data destination when sending floating point data. Appropriate cal constants are used to convert F32 values to 16-bit binary data, and thus each of these values uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT2_BUFFER_F32 (STREAM_OUT#(0:3)_BUFFER_F32@2)

Address: 4404

```
property stream_out2_buffer_status: int
```

The number of values in the buffer that are not currently being used.

Register: STREAM_OUT2_BUFFER_STATUS (STREAM_OUT#(0:3)_BUFFER_STATUS@2)

Address: 4084

```
property stream_out2_buffer_u16: int
```

Data destination when sending 16-bit integer data. Each value uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT2_BUFFER_U16 (STREAM_OUT#(0:3)_BUFFER_U16@2)

Address: 4422

```
property stream_out2_buffer_u32: int
```

Not used at this time. There are no U32 registers supported in stream-out. This register is a buffer.

Register: STREAM_OUT2_BUFFER_U32 (STREAM_OUT#(0:3)_BUFFER_U32@2)

Address: 4414

```
property stream_out2_enable: int
```

When STREAM_OUT#_ENABLE is enabled, the stream out target is generally updated by one value from the stream out buffer per stream scan. For example, there will generally be one instance of e.g. STREAM_OUT0 in the stream scan list, which will cause one STREAM_OUT0_BUFFER value to be consumed and written to STREAM_OUT0_TARGET for every stream scan. The stream scan list could also contain two instances of STREAM_OUT0, in which case two values from STREAM_OUT0_BUFFER value would be consumed and written for every stream scan.

Register: STREAM_OUT2_ENABLE (STREAM_OUT#(0:3)_ENABLE@2)

Address: 4094

```
property stream_out2_loop_num_values: int
```

The number of values, from the end of the array, that will be repeated after reaching the end of supplied data array.

Register: STREAM_OUT2_LOOP_NUM_VALUES (STREAM_OUT#(0:3)_LOOP_NUM_VALUES@2)

Address: 4064

```
property stream_out2_set_loop: int
```

Controls when new data and loop size are used. 1=Use new data immediately. 2=Wait for synch. New data will not be used until a different stream-out channel is set to Synch. 3=Synch. This stream-out# as well as any stream-outs set to synch will start using new data immediately.

Register: STREAM_OUT2_SET_LOOP (STREAM_OUT#(0:3)_SET_LOOP@2)

Address: 4074

```
property stream_out2_target: int
```

Channel that data will be written to. Before writing data to _BUFFER_###, you must write to _TARGET so the device knows how to interpret and store values.

Register: STREAM_OUT2_TARGET (STREAM_OUT#(0:3)_TARGET@2)

Address: 4044

```
property stream_out3: int
```

127) to trigger stream-out updates. When added to the scan list these do count against the max scan rate just like normal input addresses, but they do not return any data in the stream read.

Register: STREAM_OUT3 (STREAM_OUT#(0:3)@3)

Address: 4803

Type:
Include one or more of these registers in STREAM_SCANLIST_ADDRESS#(0

```
property stream_out3_buffer_allocate_num_bytes: int
```

Size of the buffer in bytes as a power of 2. Should be at least twice the size of updates that will be written and no less than 32. The usable buffer size will be equal to the value of this register minus 2 bytes (one 16-bit sample). Before writing data to _BUFFER_###, you must write to _BUFFER_ALLOCATE_NUM_BYTES to allocate RAM for the data. Max is 16384.

Register: STREAM_OUT3_BUFFER_ALLOCATE_NUM_BYTES (STREAM_OUT#(0:3)_BUFFER_ALLOCATE_NUM_BYTES@3)

Address: 4056

```
property stream_out3_buffer_f32: float
```

Data destination when sending floating point data. Appropriate cal constants are used to convert F32 values to 16-bit binary data, and thus each of these values uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT3_BUFFER_F32 (STREAM_OUT#(0:3)_BUFFER_F32@3)

Address: 4406

```
property stream_out3_buffer_status: int
```

The number of values in the buffer that are not currently being used.

Register: STREAM_OUT3_BUFFER_STATUS (STREAM_OUT#(0:3)_BUFFER_STATUS@3)

Address: 4086

```
property stream_out3_buffer_u16: int
```

Data destination when sending 16-bit integer data. Each value uses 2 bytes of the stream-out buffer. This register is a buffer.

Register: STREAM_OUT3_BUFFER_U16 (STREAM_OUT#(0:3)_BUFFER_U16@3)

Address: 4423

```
property stream_out3_buffer_u32: int
```

Not used at this time. There are no U32 registers supported in stream-out. This register is a buffer.

Register: STREAM_OUT3_BUFFER_U32 (STREAM_OUT#(0:3)_BUFFER_U32@3)

Address: 4416

```
property stream_out3_enable: int
```

When STREAM_OUT#_ENABLE is enabled, the stream out target is generally updated by one value from the stream out buffer per stream scan. For example, there will generally be one instance of e.g. STREAM_OUT0 in the stream scan list, which will cause one STREAM_OUT0_BUFFER value to be consumed and written to STREAM_OUT0_TARGET for every stream scan. The stream scan list could also contain two instances of STREAM_OUT0, in which case two values from STREAM_OUT0_BUFFER value would be consumed and written for every stream scan.

Register: STREAM_OUT3_ENABLE (STREAM_OUT#(0:3)_ENABLE@3)

Address: 4096

```
property stream_out3_loop_num_values: int
```

The number of values, from the end of the array, that will be repeated after reaching the end of supplied data array.

Register: STREAM_OUT3_LOOP_NUM_VALUES (STREAM_OUT#(0:3)_LOOP_NUM_VALUES@3)

Address: 4066

```
property stream_out3_set_loop: int
```

Controls when new data and loop size are used. 1=Use new data immediately. 2=Wait for synch. New data will not be used until a different stream-out channel is set to Synch. 3=Synch. This stream-out# as well as any stream-outs set to synch will start using new data immediately.

Register: STREAM_OUT3_SET_LOOP (STREAM_OUT#(0:3)_SET_LOOP@3)

Address: 4076

```
property stream_out3_target: int
```

Channel that data will be written to. Before writing data to _BUFFER_###, you must write to _TARGET so the device knows how to interpret and store values.

Register: STREAM_OUT3_TARGET (STREAM_OUT#(0:3)_TARGET@3)

Address: 4046

```
property stream_resolution_index: int
```

The resolution index for stream readings. A larger resolution index generally results in lower noise and longer sample times.

Register: STREAM_RESOLUTION_INDEX

Address: 4010

```
property stream_samples_per_packet: int
```

Specifies the number of data points to be sent in the data packet. Only applies to spontaneous mode.

Register: STREAM_SAMPLES_PER_PACKET

Address: 4006

```
property stream_scanlist_address0: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS0 (STREAM_SCANLIST_ADDRESS#(0:127)@0)

Address: 4100

```
property stream_scanlist_address1: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS1 (STREAM_SCANLIST_ADDRESS#(0:127)@1)

Address: 4102

```
property stream_scanlist_address10: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS10 (STREAM_SCANLIST_ADDRESS#(0:127)@10)

Address: 4120

```
property stream_scanlist_address100: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS100 (STREAM_SCANLIST_ADDRESS#(0:127)@100)

Address: 4300

```
property stream_scanlist_address101: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS101 (STREAM_SCANLIST_ADDRESS#(0:127)@101)

Address: 4302

```
property stream_scanlist_address102: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS102 (STREAM_SCANLIST_ADDRESS#(0:127)@102)

Address: 4304

```
property stream_scanlist_address103: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS103 (STREAM_SCANLIST_ADDRESS#(0:127)@103)

Address: 4306

```
property stream_scanlist_address104: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS104 (STREAM_SCANLIST_ADDRESS#(0:127)@104)

Address: 4308

```
property stream_scanlist_address105: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS105 (STREAM_SCANLIST_ADDRESS#(0:127)@105)

Address: 4310

```
property stream_scanlist_address106: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS106 (STREAM_SCANLIST_ADDRESS#(0:127)@106)

Address: 4312

```
property stream_scanlist_address107: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS107 (STREAM_SCANLIST_ADDRESS#(0:127)@107)

Address: 4314

```
property stream_scanlist_address108: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS108 (STREAM_SCANLIST_ADDRESS#(0:127)@108)

Address: 4316

```
property stream_scanlist_address109: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS109 (STREAM_SCANLIST_ADDRESS#(0:127)@109)

Address: 4318

```
property stream_scanlist_address11: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS11 (STREAM_SCANLIST_ADDRESS#(0:127)@11)

Address: 4122

```
property stream_scanlist_address110: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS110 (STREAM_SCANLIST_ADDRESS#(0:127)@110)

Address: 4320

```
property stream_scanlist_address111: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS111 (STREAM_SCANLIST_ADDRESS#(0:127)@111)

Address: 4322

```
property stream_scanlist_address112: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS112 (STREAM_SCANLIST_ADDRESS#(0:127)@112)

Address: 4324

```
property stream_scanlist_address113: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS113 (STREAM_SCANLIST_ADDRESS#(0:127)@113)

Address: 4326

```
property stream_scanlist_address114: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS114 (STREAM_SCANLIST_ADDRESS#(0:127)@114)

Address: 4328

```
property stream_scanlist_address115: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS115 (STREAM_SCANLIST_ADDRESS#(0:127)@115)

Address: 4330

```
property stream_scanlist_address116: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS116 (STREAM_SCANLIST_ADDRESS#(0:127)@116)

Address: 4332

```
property stream_scanlist_address117: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS117 (STREAM_SCANLIST_ADDRESS#(0:127)@117)

Address: 4334

```
property stream_scanlist_address118: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS118 (STREAM_SCANLIST_ADDRESS#(0:127)@118)

Address: 4336

```
property stream_scanlist_address119: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS119 (STREAM_SCANLIST_ADDRESS#(0:127)@119)

Address: 4338

```
property stream_scanlist_address12: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

property stream_scanlist_address98: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS98 (STREAM_SCANLIST_ADDRESS#(0:127)@98)

Address: 4296

```
property stream_scanlist_address99: int
```

A list of addresses to read each scan. In the case of Stream-Out enabled, the list may also include something to write each scan.

Register: STREAM_SCANLIST_ADDRESS99 (STREAM_SCANLIST_ADDRESS#(0:127)@99)

Address: 4298

```
property stream_scanrate_hz: float
```

Write a value to specify the number of times per second that all channels in the stream scanlist will be read. Max stream speeds are based on Sample Rate which is NumChannels*ScanRate. Has no effect when using an external clock. A read of this register returns the actual scan rate, which can be slightly different due to rounding. For scan rates >152.588, the actual scan interval is multiples of 100 ns. Assuming a core clock of 80 MHz the internal roll value is (80M/(8*DesiredScanRate))-1 and the actual scan rate is then 80M/(8*(RollValue+1). For slower scan rates the scan interval resolution is changed to 1 us, 10 us, 100 us, or 1 ms as needed to achieve the longer intervals.

Register: STREAM_SCANRATE_HZ

Address: 4002

```
property stream_settling_us: float
```

Time in microseconds to allow signals to settle after switching the mux. Does not apply to the 1st channel in the scan list, as that settling is controlled by scan rate (the time from the last channel until the start of the next scan). Default=0. When set to less than 1, automatic settling will be used. The automatic settling behavior varies by device.

Register: STREAM_SETTLING_US

Address: 4008

```
property stream_start_time_stamp: int
```

This register stores the value of CORE_TIMER at the start of the first stream scan. Note that the first stream scan happens 1 scan period after STREAM_ENABLE is set to 1.

Register: STREAM_START_TIME_STAMP

Address: 4026

```
property stream_trigger_index: int
```

Controls when stream scanning will start. 0 = Start when stream is enabled, 2000 = Start when DIO_EF0 detects an edge, 2001 = Start when DIO_EF1 detects an edge. See the stream documentation for all supported values.

Register: STREAM_TRIGGER_INDEX

Address: 4024

```
property system_counter_10khz: int
```

A 10 kHz counter synchronized to RTC_TIME_S. This register can be appended to RTC_TIME_S as the decimal portion to get 0.1 ms resolution.

Register: SYSTEM_COUNTER_10KHZ

Address: 61502

```
property system_reboot: int
```

Issues a device reboot. Must write 0x4C4Axxxx, where xxxx is number of 50ms ticks to wait before reboot. To reboot immediately write 0x4C4A0000 (d1279918080).

Register: SYSTEM_REBOOT

Address: 61998

```
property system_timer_20hz: int
```

Internal 32-bit system timer running at 20Hz.

Register: SYSTEM_TIMER_20HZ

Address: 61522

```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC3 (TDAC#(0:21)@3)

Address: 30006

```
property tdac4: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC4 (TDAC#(0:21)@4)

Address: 30008

```
property tdac5: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC5 (TDAC#(0:21)@5)

Address: 30010

```
property tdac6: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC6 (TDAC#(0:21)@6)

Address: 30012

```
property tdac7: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC7 (TDAC#(0:21)@7)

Address: 30014

```
property tdac8: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC8 (TDAC#(0:21)@8)

Address: 30016

```
property tdac9: float
```

Update a voltage output on a connected LJTick-DAC accessory. Even TDAC# = DACA, Odd TDAC# = DACB. For instance, if LJTick-DAC accessory is connected to FIO2/FIO3 block on main device, TDAC2 corresponds with DACA, and TDAC3 corresponds with DACB.

Register: TDAC9 (TDAC#(0:21)@9)

Address: 30018

```
property tdac_serial_number: int
```

Returns the serial number of an LJTick-DAC, and forces a re-read of the calibration constants. Which LJTDAC is determined by the last write to TDAC# ... whether it was successful or not.

Register: TDAC_SERIAL_NUMBER

Address: 55200

```
property tdac_speed_throttle: int
```

Sets the I2C clock speed that will be used when communicating with the TDAC. Default value is 65516. See I2C_SPEED_THROTTLE for more detail.

Register: TDAC_SPEED_THROTTLE

Address: 55202

```
property temperature0: float
```

T8 Only. Returns the temperature of the specified analog input. And saves AIN and temperature inputs for all channels.

Register: TEMPERATURE0 (TEMPERATURE#(0:7)@0)

Address: 600

```
property temperature0_binary: int
```

T8 Only. Returns the 24-bit binary representation of the voltage output of the temperature sensor for the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command- response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: TEMPERATURE0_BINARY (TEMPERATURE#(0:7)_BINARY@0)

Address: 50600

```
property temperature0_binary_capture: int
```

T8 Only. Returns the saved 24-bit binary representation of the voltage output of the temperature sensor for the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: TEMPERATURE0_BINARY_CAPTURE (TEMPERATURE#(0:7)_BINARY_CAPTURE@0)

Address: 50700

```
property temperature0_capture: float
```

T8 Only. Returns the saved temperature of the specified analog input.

Register: TEMPERATURE0_CAPTURE (TEMPERATURE#(0:7)_CAPTURE@0)

Address: 700

```
property temperature1: float
```

T8 Only. Returns the temperature of the specified analog input. And saves AIN and temperature inputs for all channels.

Register: TEMPERATURE1 (TEMPERATURE#(0:7)@1)

Address: 602

```
property temperature1_binary: int
```

T8 Only. Returns the 24-bit binary representation of the voltage output of the temperature sensor for the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command- response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: TEMPERATURE1_BINARY (TEMPERATURE#(0:7)_BINARY@1)

Address: 50602

```
property temperature1_binary_capture: int
```

T8 Only. Returns the saved 24-bit binary representation of the voltage output of the temperature sensor for the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: TEMPERATURE1_BINARY_CAPTURE (TEMPERATURE#(0:7)_BINARY_CAPTURE@1)

Address: 50702

```
property temperature1_capture: float
```

T8 Only. Returns the saved temperature of the specified analog input.

Register: TEMPERATURE1_CAPTURE (TEMPERATURE#(0:7)_CAPTURE@1)

Address: 702

```
property temperature2: float
```

T8 Only. Returns the temperature of the specified analog input. And saves AIN and temperature inputs for all channels.

Register: TEMPERATURE2 (TEMPERATURE#(0:7)@2)

Address: 604

```
property temperature2_binary: int
```

T8 Only. Returns the 24-bit binary representation of the voltage output of the temperature sensor for the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command- response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: TEMPERATURE2_BINARY (TEMPERATURE#(0:7)_BINARY@2)

Address: 50604

```
property temperature2_binary_capture: int
```

T8 Only. Returns the saved 24-bit binary representation of the voltage output of the temperature sensor for the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: TEMPERATURE2_BINARY_CAPTURE (TEMPERATURE#(0:7)_BINARY_CAPTURE@2)

Address: 50704

```
property temperature2_capture: float
```

T8 Only. Returns the saved temperature of the specified analog input.

Register: TEMPERATURE2_CAPTURE (TEMPERATURE#(0:7)_CAPTURE@2)

Address: 704

```
property temperature3: float
```

T8 Only. Returns the temperature of the specified analog input. And saves AIN and temperature inputs for all channels.

Register: TEMPERATURE3 (TEMPERATURE#(0:7)@3)

Address: 606

```
property temperature3_binary: int
```

T8 Only. Returns the 24-bit binary representation of the voltage output of the temperature sensor for the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command- response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: TEMPERATURE3_BINARY (TEMPERATURE#(0:7)_BINARY@3)

Address: 50606

```
property temperature3_binary_capture: int
```

T8 Only. Returns the saved 24-bit binary representation of the voltage output of the temperature sensor for the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: TEMPERATURE3_BINARY_CAPTURE (TEMPERATURE#(0:7)_BINARY_CAPTURE@3)

Address: 50706

```
property temperature3_capture: float
```

T8 Only. Returns the saved temperature of the specified analog input.

Register: TEMPERATURE3_CAPTURE (TEMPERATURE#(0:7)_CAPTURE@3)

Address: 706

```
property temperature4: float
```

T8 Only. Returns the temperature of the specified analog input. And saves AIN and temperature inputs for all channels.

Register: TEMPERATURE4 (TEMPERATURE#(0:7)@4)

Address: 608

```
property temperature4_binary: int
```

T8 Only. Returns the 24-bit binary representation of the voltage output of the temperature sensor for the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command- response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: TEMPERATURE4_BINARY (TEMPERATURE#(0:7)_BINARY@4)

Address: 50608

```
property temperature4_binary_capture: int
```

T8 Only. Returns the saved 24-bit binary representation of the voltage output of the temperature sensor for the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: TEMPERATURE4_BINARY_CAPTURE (TEMPERATURE#(0:7)_BINARY_CAPTURE@4)

Address: 50708

```
property temperature4_capture: float
```

T8 Only. Returns the saved temperature of the specified analog input.

Register: TEMPERATURE4_CAPTURE (TEMPERATURE#(0:7)_CAPTURE@4)

Address: 708

```
property temperature5: float
```

T8 Only. Returns the temperature of the specified analog input. And saves AIN and temperature inputs for all channels.

Register: TEMPERATURE5 (TEMPERATURE#(0:7)@5)

Address: 610

```
property temperature5_binary: int
```

T8 Only. Returns the 24-bit binary representation of the voltage output of the temperature sensor for the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command- response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: TEMPERATURE5_BINARY (TEMPERATURE#(0:7)_BINARY@5)

Address: 50610

```
property temperature5_binary_capture: int
```

T8 Only. Returns the saved 24-bit binary representation of the voltage output of the temperature sensor for the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: TEMPERATURE5_BINARY_CAPTURE (TEMPERATURE#(0:7)_BINARY_CAPTURE@5)

Address: 50710

```
property temperature5_capture: float
```

T8 Only. Returns the saved temperature of the specified analog input.

Register: TEMPERATURE5_CAPTURE (TEMPERATURE#(0:7)_CAPTURE@5)

Address: 710

```
property temperature6: float
```

T8 Only. Returns the temperature of the specified analog input. And saves AIN and temperature inputs for all channels.

Register: TEMPERATURE6 (TEMPERATURE#(0:7)@6)

Address: 612

```
property temperature6_binary: int
```

T8 Only. Returns the 24-bit binary representation of the voltage output of the temperature sensor for the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command- response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: TEMPERATURE6_BINARY (TEMPERATURE#(0:7)_BINARY@6)

Address: 50612

```
property temperature6_binary_capture: int
```

T8 Only. Returns the saved 24-bit binary representation of the voltage output of the temperature sensor for the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: TEMPERATURE6_BINARY_CAPTURE (TEMPERATURE#(0:7)_BINARY_CAPTURE@6)

Address: 50712

```
property temperature6_capture: float
```

T8 Only. Returns the saved temperature of the specified analog input.

Register: TEMPERATURE6_CAPTURE (TEMPERATURE#(0:7)_CAPTURE@6)

Address: 712

```
property temperature7: float
```

T8 Only. Returns the temperature of the specified analog input. And saves AIN and temperature inputs for all channels.

Register: TEMPERATURE7 (TEMPERATURE#(0:7)@7)

Address: 614

```
property temperature7_binary: int
```

T8 Only. Returns the 24-bit binary representation of the voltage output of the temperature sensor for the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command- response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: TEMPERATURE7_BINARY (TEMPERATURE#(0:7)_BINARY@7)

Address: 50614

```
property temperature7_binary_capture: int
```

T8 Only. Returns the saved 24-bit binary representation of the voltage output of the temperature sensor for the specified analog input. If you prefer 16-bit representation, simply divide this by 256. This is for command-response only. Stream always returns binary and LJM applies cal constants, so the LJM config flag LJM_STREAM_AIN_BINARY is used to get binary values.

Register: TEMPERATURE7_BINARY_CAPTURE (TEMPERATURE#(0:7)_BINARY_CAPTURE@7)

Address: 50714

```
property temperature7_capture: float
```

T8 Only. Returns the saved temperature of the specified analog input.

Register: TEMPERATURE7_CAPTURE (TEMPERATURE#(0:7)_CAPTURE@7)

Address: 714

```
property temperature_air_k: float
```

Returns the estimated ambient air temperature just outside of the device in its red plastic enclosure. This register is equal to TEMPERATURE_DEVICE_K - 4.3. If Ethernet and/or WiFi is enabled, subtract an extra 0.6 for each.

Register: TEMPERATURE_AIR_K

Address: 60050

```
property temperature_device_k: float
```

Takes a reading from the internal temperature sensor using range=+/-10V and resolution=8, and applies the formula Volts*-92.6+467.6 to return kelvins.

Register: TEMPERATURE_DEVICE_K

Address: 60052

```
property test: int
```

A read of this test register should always return 0x00112233 or d1122867. If your software has the word swap quirk, you will incorrectly read 0x22330011 or 573767697. If your software has the address-1 quirk, a UINT16 (1-register) read from 55101 will incorrectly return 0x0011 (should read 0x2233). This register is unlike others, in that it allows you can read a single word from 55100 or 55101, or of course 2 words from 55100.

Register: TEST

Address: 55100

```
property test_float32: float
```

Write a value and read back to test FLOAT32 operation. Default is 0xC61C3C00 or -9999.0. If your software has the word swap quirk, the default will incorrectly read 0x3C00C61C or 0.00786.

Register: TEST_FLOAT32

Address: 55124

```
property test_int32: int
```

Write a value and read back to test INT32 operation. Default is 0x8899AABB or d-2003195205. If your software has the word swap quirk, the default will incorrectly read 0xAABB8899 or -1430550375.

Register: TEST_INT32

Address: 55122

```
property test_uint16: int
```

Write a value and read back to test UINT16 operation. Default is 0x0011 or d17.

Register: TEST_UINT16

Address: 55110

```
property test_uint32: int
```

Write a value and read back to test UINT32 operation. Default is 0x00112233 or d1122867. If your software has the word swap quirk, the default will incorrectly read 0x22330011 or 573767697.

Register: TEST_UINT32

Address: 55120

```

```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM1_U16 (USER_RAM#(0:19)_U16@1)

Address: 46181

```
property user_ram1_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM1_U32 (USER_RAM#(0:39)_U32@1)

Address: 46102

```
property user_ram20_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM20_F32 (USER_RAM#(0:39)_F32@20)

Address: 46040

```
property user_ram20_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM20_U32 (USER_RAM#(0:39)_U32@20)

Address: 46140

```
property user_ram21_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM21_F32 (USER_RAM#(0:39)_F32@21)

Address: 46042

```
property user_ram21_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM21_U32 (USER_RAM#(0:39)_U32@21)

Address: 46142

```
property user_ram22_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM22_F32 (USER_RAM#(0:39)_F32@22)

Address: 46044

```
property user_ram22_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM22_U32 (USER_RAM#(0:39)_U32@22)

Address: 46144

```
property user_ram23_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM23_F32 (USER_RAM#(0:39)_F32@23)

Address: 46046

```
property user_ram23_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM23_U32 (USER_RAM#(0:39)_U32@23)

Address: 46146

```
property user_ram24_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM24_F32 (USER_RAM#(0:39)_F32@24)

Address: 46048

```
property user_ram24_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM24_U32 (USER_RAM#(0:39)_U32@24)

Address: 46148

```
property user_ram25_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM25_F32 (USER_RAM#(0:39)_F32@25)

Address: 46050

```
property user_ram25_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM25_U32 (USER_RAM#(0:39)_U32@25)

Address: 46150

```
property user_ram26_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM26_F32 (USER_RAM#(0:39)_F32@26)

Address: 46052

```
property user_ram26_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM26_U32 (USER_RAM#(0:39)_U32@26)

Address: 46152

```
property user_ram27_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM27_F32 (USER_RAM#(0:39)_F32@27)

Address: 46054

```
property user_ram27_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM27_U32 (USER_RAM#(0:39)_U32@27)

Address: 46154

```
property user_ram28_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM28_F32 (USER_RAM#(0:39)_F32@28)

Address: 46056

```
property user_ram28_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM28_U32 (USER_RAM#(0:39)_U32@28)

Address: 46156

```
property user_ram29_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM29_F32 (USER_RAM#(0:39)_F32@29)

Address: 46058

```
property user_ram29_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM29_U32 (USER_RAM#(0:39)_U32@29)

Address: 46158

```
property user_ram2_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM2_F32 (USER_RAM#(0:39)_F32@2)

Address: 46004

```
property user_ram2_i32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM2_I32 (USER_RAM#(0:9)_I32@2)

Address: 46084

```
property user_ram2_u16: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM2_U16 (USER_RAM#(0:19)_U16@2)

Address: 46182

```
property user_ram2_u32: int

```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM7_U32 (USER_RAM#(0:39)_U32@7)

Address: 46114

```
property user_ram8_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM8_F32 (USER_RAM#(0:39)_F32@8)

Address: 46016

```
property user_ram8_i32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM8_I32 (USER_RAM#(0:9)_I32@8)

Address: 46096

```
property user_ram8_u16: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM8_U16 (USER_RAM#(0:19)_U16@8)

Address: 46188

```
property user_ram8_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM8_U32 (USER_RAM#(0:39)_U32@8)

Address: 46116

```
property user_ram9_f32: float
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM9_F32 (USER_RAM#(0:39)_F32@9)

Address: 46018

```
property user_ram9_i32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM9_I32 (USER_RAM#(0:9)_I32@9)

Address: 46098

```
property user_ram9_u16: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM9_U16 (USER_RAM#(0:19)_U16@9)

Address: 46189

```
property user_ram9_u32: int
```

Generic RAM registers. Useful for passing data between a host computer and a Lua script. Will not return an error if alternate data types are used.

Register: USER_RAM9_U32 (USER_RAM#(0:39)_U32@9)

Address: 46118

```
property user_ram_fifo0_allocate_num_bytes: int
```

Allocate memory for a FIFO buffer. Number of bytes should be sufficient to store users max transfer array size. Note that FLOAT32, INT32, and UINT32 require 4 bytes per value, and UINT16 require 2 bytes per value. Maximum size is limited by available memory. Care should be taken to conserve enough memory for other operations such as AIN_EF, Lua, Stream etc.

Register: USER_RAM_FIFO0_ALLOCATE_NUM_BYTES
(USER_RAM_FIFO#(0:3)_ALLOCATE_NUM_BYTES@0)

Address: 47900

```
property user_ram_fifo0_data_f32: float
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO0_DATA_F32 (USER_RAM_FIFO#(0:3)_DATA_F32@0)

Address: 47030

```
property user_ram_fifo0_data_i32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO0_DATA_I32 (USER_RAM_FIFO#(0:3)_DATA_I32@0)

Address: 47020

```
property user_ram_fifo0_data_u16: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO0_DATA_U16 (USER_RAM_FIFO#(0:3)_DATA_U16@0)

Address: 47000

```
property user_ram_fifo0_data_u32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO0_DATA_U32 (USER_RAM_FIFO#(0:3)_DATA_U32@0)

Address: 47010

```
property user_ram_fifo0_empty: int
```

Write any value to this register to efficiently empty, flush, or otherwise clear data from the FIFO.

Register: USER_RAM_FIFO0_EMPTY (USER_RAM_FIFO#(0:3)_EMPTY@0)

Address: 47930

```
property user_ram_fifo0_num_bytes_in_fifo: int
```

Poll this register to see when new data is available/ready. Each read of the FIFO buffer decreases this value, and each write to the FIFO buffer increases this value.

At any point in time, the following equation holds: Nbytes = Nwritten - Nread.

Register: USER_RAM_FIFO0_NUM_BYTES_IN_FIFO
(USER_RAM_FIFO#(0:3)_NUM_BYTES_IN_FIFO@0)

Address: 47910

```
property user_ram_fifo1_allocate_num_bytes: int
```

Allocate memory for a FIFO buffer. Number of bytes should be sufficient to store users max transfer array size. Note that FLOAT32, INT32, and UINT32 require 4 bytes per value, and UINT16 require 2 bytes per value. Maximum size is limited by available memory. Care should be taken to conserve enough memory for other operations such as AIN_EF, Lua, Stream etc.

Register: USER_RAM_FIFO1_ALLOCATE_NUM_BYTES
(USER_RAM_FIFO#(0:3)_ALLOCATE_NUM_BYTES@1)

Address: 47902

```
property user_ram_fifo1_data_f32: float
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO1_DATA_F32 (USER_RAM_FIFO#(0:3)_DATA_F32@1)

Address: 47032

```
property user_ram_fifo1_data_i32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO1_DATA_I32 (USER_RAM_FIFO#(0:3)_DATA_I32@1)

Address: 47022

```
property user_ram_fifo1_data_u16: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO1_DATA_U16 (USER_RAM_FIFO#(0:3)_DATA_U16@1)

Address: 47001

```
property user_ram_fifo1_data_u32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO1_DATA_U32 (USER_RAM_FIFO#(0:3)_DATA_U32@1)

Address: 47012

```
property user_ram_fifo1_empty: int
```

Write any value to this register to efficiently empty, flush, or otherwise clear data from the FIFO.

Register: USER_RAM_FIFO1_EMPTY (USER_RAM_FIFO#(0:3)_EMPTY@1)

Address: 47932

```
property user_ram_fifo1_num_bytes_in_fifo: int
```

Poll this register to see when new data is available/ready. Each read of the FIFO buffer decreases this value, and each write to the FIFO buffer increases this value.

At any point in time, the following equation holds: Nbytes = Nwritten - Nread.

Register: USER_RAM_FIFO1_NUM_BYTES_IN_FIFO
(USER_RAM_FIFO#(0:3)_NUM_BYTES_IN_FIFO@1)

Address: 47912

```
property user_ram_fifo2_allocate_num_bytes: int
```

Allocate memory for a FIFO buffer. Number of bytes should be sufficient to store users max transfer array size. Note that FLOAT32, INT32, and UINT32 require 4 bytes per value, and UINT16 require 2 bytes per value. Maximum size is limited by available memory. Care should be taken to conserve enough memory for other operations such as AIN_EF, Lua, Stream etc.

Register: USER_RAM_FIFO2_ALLOCATE_NUM_BYTES
(USER_RAM_FIFO#(0:3)_ALLOCATE_NUM_BYTES@2)

Address: 47904

```
property user_ram_fifo2_data_f32: float
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO2_DATA_F32 (USER_RAM_FIFO#(0:3)_DATA_F32@2)

Address: 47034

```
property user_ram_fifo2_data_i32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO2_DATA_I32 (USER_RAM_FIFO#(0:3)_DATA_I32@2)

Address: 47024

```
property user_ram_fifo2_data_u16: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO2_DATA_U16 (USER_RAM_FIFO#(0:3)_DATA_U16@2)

Address: 47002

```
property user_ram_fifo2_data_u32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO2_DATA_U32 (USER_RAM_FIFO#(0:3)_DATA_U32@2)

Address: 47014

```
property user_ram_fifo2_empty: int
```

Write any value to this register to efficiently empty, flush, or otherwise clear data from the FIFO.

Register: USER_RAM_FIFO2_EMPTY (USER_RAM_FIFO#(0:3)_EMPTY@2)

Address: 47934

```
property user_ram_fifo2_num_bytes_in_fifo: int
```

Poll this register to see when new data is available/ready. Each read of the FIFO buffer decreases this value, and each write to the FIFO buffer increases this value.

At any point in time, the following equation holds: Nbytes = Nwritten - Nread.

Register: USER_RAM_FIFO2_NUM_BYTES_IN_FIFO
(USER_RAM_FIFO#(0:3)_NUM_BYTES_IN_FIFO@2)

Address: 47914

```
property user_ram_fifo3_allocate_num_bytes: int
```

Allocate memory for a FIFO buffer. Number of bytes should be sufficient to store users max transfer array size. Note that FLOAT32, INT32, and UINT32 require 4 bytes per value, and UINT16 require 2 bytes per value. Maximum size is limited by available memory. Care should be taken to conserve enough memory for other operations such as AIN_EF, Lua, Stream etc.

Register: USER_RAM_FIFO3_ALLOCATE_NUM_BYTES
(USER_RAM_FIFO#(0:3)_ALLOCATE_NUM_BYTES@3)

Address: 47906

```
property user_ram_fifo3_data_f32: float
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO3_DATA_F32 (USER_RAM_FIFO#(0:3)_DATA_F32@3)

Address: 47036

```
property user_ram_fifo3_data_i32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO3_DATA_I32 (USER_RAM_FIFO#(0:3)_DATA_I32@3)

Address: 47026

```
property user_ram_fifo3_data_u16: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO3_DATA_U16 (USER_RAM_FIFO#(0:3)_DATA_U16@3)

Address: 47003

```
property user_ram_fifo3_data_u32: int
```

Generic FIFO buffer. Useful for passing ORDERED or SEQUENTIAL data between various endpoints, such as between a host and a Lua script. Use up to 4 FIFO buffers simultaneously->1 of each data type, all 4 different data types, or a mixture. e.g. FIFO0_DATA_U16 points to the same memory as other FIFO0 registers, such that there are a total of 4 memory blocks: FIFO0, FIFO1, FIFO2 and FIFO3. It is possible to write into a FIFO buffer using a different datatype than is being used to read out of it.

This register is a buffer. Underrun behavior - throws an error.

Register: USER_RAM_FIFO3_DATA_U32 (USER_RAM_FIFO#(0:3)_DATA_U32@3)

Address: 47016

```
property user_ram_fifo3_empty: int
```

Write any value to this register to efficiently empty, flush, or otherwise clear data from the FIFO.

Register: USER_RAM_FIFO3_EMPTY (USER_RAM_FIFO#(0:3)_EMPTY@3)

Address: 47936

```
property user_ram_fifo3_num_bytes_in_fifo: int
```

Poll this register to see when new data is available/ready. Each read of the FIFO buffer decreases this value, and each write to the FIFO buffer increases this value.

At any point in time, the following equation holds: Nbytes = Nwritten - Nread.

Register: USER_RAM_FIFO3_NUM_BYTES_IN_FIFO
(USER_RAM_FIFO#(0:3)_NUM_BYTES_IN_FIFO@3)

Address: 47916

```
property wait_us_blocking: int
```

Delays for x microseconds. Range is 0-100000. This operation is Blocking. While a blocking function is running no other registers can be read / written.

Register: WAIT_US_BLOCKING

Address: 61590

```
property watchdog_advanced_default: int
```

A single binary-encoded value where each bit is an advanced option. If bit 0 is set, IO_CONFIG_SET_CURRENT_TO_FACTORY will be done on timeout. If bit 1 is set, IO_CONFIG_SET_CURRENT_TO_DEFAULT will be done on timeout.

Register: WATCHDOG_ADVANCED_DEFAULT

Address: 61602

```
property watchdog_dac0_default: float
```

The voltage of DAC0 after a Watchdog timeout.

Register: WATCHDOG_DAC0_DEFAULT

Address: 61642

```
property watchdog_dac0_enable_default: int
```

Timeout action: Set to 1 to enable DAC0 update on watchdog timeout.

Register: WATCHDOG_DAC0_ENABLE_DEFAULT

Address: 61640

```
property watchdog_dac1_default: float
```

The voltage of DAC1 after a Watchdog timeout.

Register: WATCHDOG_DAC1_DEFAULT

Address: 61652

```
property watchdog_dac1_enable_default: int
```

Timeout action: Set to 1 to enable DAC1 update on watchdog timeout.

Register: WATCHDOG_DAC1_ENABLE_DEFAULT

Address: 61650

```
property watchdog_dio_direction_default: int
```

The direction input/output of the digital I/O after a Watchdog timeout. See DIO_DIRECTION.

Register: WATCHDOG_DIO_DIRECTION_DEFAULT

Address: 61634

```
property watchdog_dio_enable_default: int
```

Timeout action: Set to 1 to enable DIO update on watchdog timeout.

Register: WATCHDOG_DIO_ENABLE_DEFAULT

Address: 61630

```
property watchdog_dio_inhibit_default: int
```

This register can be used to prevent the watchdog from changing specific IO. See DIO_INHIBIT for more information.

Register: WATCHDOG_DIO_INHIBIT_DEFAULT

Address: 61636

```
property watchdog_dio_state_default: int
```

The state high/low of the digital I/O after a Watchdog timeout. See DIO_STATE.

Register: WATCHDOG_DIO_STATE_DEFAULT

Address: 61632

```
property watchdog_enable_default: int
```

Write a 1 to enable the watchdog or a 0 to disable. The watchdog must be disabled before writing any of the other watchdog registers (except for WATCHDOG_STRICT_CLEAR).

Register: WATCHDOG_ENABLE_DEFAULT

Address: 61600

```
property watchdog_reset_enable_default: int
```

Timeout action: Set to 1 to enable device-reset on watchdog timeout.

Register: WATCHDOG_RESET_ENABLE_DEFAULT

Address: 61620

```
property watchdog_startup_delay_s_default: int
```

This specifies the initial timeout period at device bootup. This is used until the first time the watchdog is cleared or timeout ... after that the normal timeout is used.

Register: WATCHDOG_STARTUP_DELAY_S_DEFAULT

Address: 61606

```
property watchdog_strict_clear: int
```

When running in strict mode, writing the key to this register is the only way to clear the watchdog. Writing to this register while not using strict mode will clear the watchdog.

Register: WATCHDOG_STRICT_CLEAR

Address: 61614

```
property watchdog_strict_enable_default: int
```

Set to 1 to enable strict mode.

Register: WATCHDOG_STRICT_ENABLE_DEFAULT

Address: 61610

```
property watchdog_strict_key_default: int
```

When set to strict mode, this is the value that must be written to the clear register.

Register: WATCHDOG_STRICT_KEY_DEFAULT

Address: 61612

```
property watchdog_timeout_s_default: int
```

When the device receives any communication over USB/Ethernet/WiFi, the watchdog timer is cleared. If the watchdog timer is not cleared within the timeout period, the enabled actions will be done.

Register: WATCHDOG_TIMEOUT_S_DEFAULT

Address: 61604

```
property wifi_apply_settings: int
```

Apply all new WiFi settings: IP, Subnet, Gateway, DHCP, SSID, Password. 1=Apply

Register: WIFI_APPLY_SETTINGS

Address: 49400

```
property wifi_dhcp_enable: int
```

Read the current Enabled/Disabled state of WiFi DHCP.

Register: WIFI_DHCP_ENABLE

Address: 49210

```
property wifi_dhcp_enable_default: int
```

The new Enabled/Disabled state of WiFi DHCP. Use WIFI_APPLY_SETTINGS.

Register: WIFI_DHCP_ENABLE_DEFAULT

Address: 49260

```
property wifi_firmware_update_status: int
```

CONFIGURING = 2920, IN_PROGRESS = 2921, REBOOTING = 2923, UPDATE_SUCCESS = 2924, UPDATE_FAILED = 2925.

Register: WIFI_FIRMWARE_UPDATE_STATUS

Address: 49454

```
property wifi_firmware_update_to_versionx: float
```

Start an update by using USB or Ethernet to write the desired version to update to.

Register: WIFI_FIRMWARE_UPDATE_TO_VERSIONX

Address: 49402

```
property wifi_gateway: str
```

Read the current gateway of WiFi.

Register: WIFI_GATEWAY

Address: 49204

```
property wifi_gateway_default: str
```

The new gateway of WiFi. Use WIFI_APPLY_SETTINGS.

Register: WIFI_GATEWAY_DEFAULT

Address: 49254

```
property wifi_ip: str
```

Read the current IP address of WiFi.

Register: WIFI_IP

Address: 49200

```
property wifi_ip_default: str
```

The new IP address of WiFi. Use WIFI_APPLY_SETTINGS.

Register: WIFI_IP_DEFAULT

Address: 49250

```
property wifi_mac: str
```

The MAC address of the WiFi module.

Register: WIFI_MAC

Address: 60024

```
property wifi_password_default: str
```

Write the password for the WiFi network, then use WIFI_APPLY_SETTINGS.

Register: WIFI_PASSWORD_DEFAULT

Address: 49350

```
property wifi_rssi: float
```

WiFi RSSI (signal strength). Typical values are -40 for very good, and -75 for very weak. The T7 microcontroller only gets a new RSSI value from the WiFi module when WiFi communication occurs.

Register: WIFI_RSSI

Address: 49452

```
property wifi_ssid: str
```

Read the current SSID (network name) of WiFi.

Register: WIFI_SSID

Address: 49300

```
property wifi_ssid_default: str
```

The new SSID (network name) of WiFi. Use WIFI_APPLY_SETTINGS.

Register: WIFI_SSID_DEFAULT

Address: 49325

```
property wifi_status: int
```

Status Codes: ASSOCIATED = 2900, ASSOCIATING = 2901, ASSOCIATION_FAILED = 2902, UNPOWERED = 2903, BOOTING = 2904, START_FAILED = 2905, APPLYING_SETTINGS = 2906, DHCP_STARTED = 2907, OTHER = 2909

Register: WIFI_STATUS

Address: 49450

```
property wifi_subnet: str
```

Read the current subnet of WiFi.

Register: WIFI_SUBNET

Address: 49202

```
property wifi_subnet_default: str
```

The new subnet of WiFi. Use WIFI_APPLY_SETTINGS.

Register: WIFI_SUBNET_DEFAULT

Address: 49252

```
property wifi_udp_discovery_only: int
```

Restricts which Modbus operations are allowed over UDP. When set to 1, only the registers needed for discovering units can be read and any other operation will throw an error.

Register: WIFI_UDP_DISCOVERY_ONLY

Address: 49215

```
property wifi_udp_discovery_only_default: int
```

The Enabled/Disabled state of WIFI_UDP_DISCOVERY_ONLY after a power-cycle to the device.

Register: WIFI_UDP_DISCOVERY_ONLY_DEFAULT

Address: 49265

```
property wifi_version: float
```

The current firmware version of the WiFi module, if available.

Register: WIFI_VERSION

Address: 60008

IO — HILSTER's proprietary IO-hardware

Introduction

HILSTER offers prorietary IO-hardware that is DIN rail mountable. Currently there are four different types and sizes available.

You need the `io` feature in your license to unlock the IO hardware features.

For every device an abstraction is available. To read inputs or write outputs you simply have to assign a value to an output or read an input. The abstractors offer members with the name of the inputs and outputs, e.g. `io.R6` for relay 6, `io.DO0` for digital output 0 or `io.AI3` for analog input 3.

For example to switch on a relay `io.R6` you have to assign `True` to it.

```
io.R6 = True
```

To reset the reley you have to assign `False`.

```
io.R6 = False
```

To set the digital output pin `io.D3` you have to assign `True` to it.

```
io.D3 = True
```

To reset the digital output pin assign `False` to it.

```
io.R6 = False
```

To set an analog (pwm) level to 50 % you have to assign an integer value knowing the underlying pwm type. In the following example an 8-bit-pwm is assumed.

```
io.AO0 = 0xf7  # 50 % pwm level
```

Finally to read an analog level you have to read you simply have to read an analog input

```
analog_value = io.AI3
```

IO Mini

Features:

- 6 relays (230 V/6 A)
- 8 analog/digital inputs
- 4 digital outputs (2 A)
- 1 UART
- 1 SPI
- 1 I2C
- RTC

A sample implementation and usage can be found here:

```
from htf.io import IOMini as IO
io = IO("/dev/ttyACM0")
# set D1
io.D1 = True
# reset D1
io.D1 = False
#read A0
analog_value = io.A0
#read D0
digital_value = io.D0
# etc.
```

```
class htf.io.IOMini(port: str, timeout: int | float = 1.0)
```

Initialize an IOMini.

Parameters:

- **port** – the name of the serial connection
- **timeout=1.0** – the time-out in seconds

```
A0
```

Analog input A0

```
A1
```

Analog input A1

```
A2
```

Digital output D6

```
D7
```

Digital output D7

```
IN0
```

Digital input IN0

```
IN1
```

Digital input IN1

```
__del__() → None
```

Automatically close serial connection on deletion.

```
close() → None
```

Close the serial connection.

```
get_board_name() → str
```

Return the board name read from the device.

```
get_version() → int
```

Return the version read from the device.

IO Maxi

Features:

- 10 relays (230V/6A)
- 2 analog outputs (0 to 10 V)
- 12 analog inputs (24 V)
- 12 digital inputs (24 V)
- 8 digital outputs (24 V)
- 2 UART
- 1 SPI
- 1 I2C
- RTC
- Ethernet

A sample implementation and usage can be found here:

```
from htf.io import IOMaxi as IO
io = IO("/dev/ttyACM0")
# set R6
io.R6 = True
# reset R6
io.R6 = False
#read AI0
analog_value = io.AI0
```

```
#read DI0
digital_value = io.DI0
# etc.
```

```
class htf.io.IOMaxi(port: str, timeout: int | float = 1.0)
```

Initialize an IOMaxi.

Parameters:

- **port** – the name of the serial connection
- **timeout=1.0** – the time-out in seconds

```
A0
```

Analog input A0

```
A1
```

Analog input A1

```

```

Relay R9

```
__del__() → None
```

Automatically close serial connection on deletion.

```
close() → None
```

Close the serial connection.

```
get_board_name() → str
```

Return the board name read from the device.

```
get_version() → int
```

Return the version read from the device.

IO Maxi Automation

Features:

- 10 relays (230 V/6 A)
- 2 analog outputs (0 to 24 V)
- 2 analog inputs (10 V)
- 12 analog/digital inputs (24 V)
- 4 digital inputs (24 V)
- 8 digital outputs (24 V)
- 2 UART
- 1 SPI

- 1 I2C
- RTC
- Ethernet

A sample impelentation and usage can be found here:

```
from htf.io import IOMaxiAutomation as IO
io = IO("/dev/ttyACM0")
# set R6
io.R6 = True
# reset R6
io.R6 = False
#read AI0
analog_value = io.AI0
#read DI0
digital_value = io.DI0
# etc.
```

```
class htf.io.IOMaxiAutomation(port: str, timeout: int | float = 1.0)
```

Initialize an IOMaxiAutomation.

Parameters:

- **port** – the name of the serial connection
- **timeout=1.0** – the time-out in seconds

```
AI0
```

Analog input AI0

```
AI1
```

__del__() → None
```

Automatically close serial connection on deletion.

```
close() → None
```

Close the serial connection.

```
get_board_name() → str
```

Return the board name read from the device.

```
get_version() → int
```

Return the version read from the device.

IO Mega

Features:

- 16 relays (230 V/6 A)
- 2 analog outputs (0 to 10 V)
- 21 analog inputs (24 V)
- 12 digital outputs (24 V)
- 2 UART
- 1 RS485
- 1 SPI
- 1 I2C
- RTC
- Ethernet

A sample implementation and usage can be found here:

```
from htf.io import IOMega as IO
io = IO("/dev/ttyACM0")
# set R6
io.R6 = True
# reset R6
io.R6 = False
#read AI0
analog_value = io.AI0
#read DI0
digital_value = io.DI0
# etc.
```

```
class htf.io.IOMega(port: str, timeout: int | float = 1.0)
```

Initialize an IOMega.

Parameters:

- **port** – the name of the serial connection
- **timeout=1.0** – the time-out in seconds

Changelog

htf-io-4.3.0

- ship `cp312-abi3` wheels that are compatible with Python 3.12 and newer versions

htf-io-4.2.1

- implement Cyber Resilience Act Conformity (CRA)
- update dependencies

htf-io-4.2.0

- add support for Xentara

htf-io-4.1.5

- add support for Python 3.13

htf-io-4.1.4

- add requirements for validation purposes

htf-io-4.1.3

- add build environment data for validation purposes

htf-io-4.1.2

- `htf-io` can now be used standalone

htf-io-4.1.1

- add support for Python 3.12

htf-io-4.1.0

- add support for LabJack DAQ devices

htf-io-4.0.0

- remove all camel-case methods
- add type-hints
- use `hlm-3.1`
- use `oser-3.1`

htf-io-3.0.2

- add support for Python 3.11

htf-io-3.0.1

- fix an import error

htf-io-3.0.0

- extract `htf-io` from `htf`

Arduino — Simple IO using open source hardware

Generic Arduino Support

Generic Arduino abstractors support digital input with and without internal pullup, digital output, analog input and analog output (pwm).

Pins are read and written by simply reading from or writing to member variables of the used abstractor.

Digital output pins are accessed by writing a boolean or integer value to `do<N>` or `digital_output<N>` where `<N>` is the pin number. Additionally you can call the method `digital_output(pin)` if you like to. When writing a digital output pin the pin is automatically set to digital output mode.

Digital input pins can be accessed by reading `di<N>` or `digital_input<N>` where `<N>` is the pin number. Additionally you can call the method `digital_input(pin)` if you like to. When reading a digital input pin the pin is automatically set to digital input mode.

Digital input pins with internal pullup can be accessed by reading `dip<N>` or `digital_input_pullup<N>` where `<N>` is the pin number. Additionally you can call the method `digital_input_pullup(pin)` if you like to. When reading a digital input pin with internal pullup the pin is automatically set to digital input mode with pullup enabled.

Analog output or pwm pins are accessed by writing an integer value (0 .. 255) to `pwm<N>`, `ao<N>` or `analog_output<N>` where `<N>` is the pin number. Additionally you can call the method `analog_output(pin)` if you like to. When writing an analog output (pwm) pin the pin is automatically set to analog output (pwm) mode. There are different names for the same pins. This is useful to give you code a better understanding of what happens when the pin is set. A pwm pin with a low-pass filter connected results in an analog voltage so the user would rather use `ao<N>` instead of `pwm<N>`.

Analog input pins are accessed by reading `ai<N>` or `analog_input<N>` where `<N>` is the pin number. Additionally you can call the method `analog_input(pin)` or `pwm(pin)` if you like to. When reading an analog input the pin is automatically set to analog input mode.

You need the `io` feature in your license to unlock the Arduino features.

Arduino Nano

`htf.arduino.ArduinoNano` supports 12 digital input pins with and without internal pullup (D2 .. D13), 12 digital output pins (D2 .. D13), 8 analog input pins (A0 .. A7) and 6 analog output (pwm) pins (D3, D5, D6, D9, D10, and D11).

To setup the Arduino Nano use:

```
from htf.arduino import ArduinoNano
a = ArduinoNano("/dev/ttyUSB0")
# set pin D1 to 1
a.do3 = 1
```

```
# set pin D1 to 0
a.do3 = 0
# read pin D4
a.di4
>>> 0
# read pin D4 with internal pullup
a.dip4
>>> 1
# read A3
a.ai3
>>> 486
# set pwm level to 50 % on D3
a.pwm3 = 0x8f
# set analog voltage to 5 V on D5
a.ao5 = 0xff
```

```
class htf.arduino.ArduinoNano(port: str, timeout: int | float = 0.5)
```

Initialize an ArduinoNano.

Parameters:

- **port** – the name of the serial connection
- **timeout=0.5** – the time-out in seconds

```
__del__() → None
```

Automatically close serial connection on deletion.

```
analog_input(pin: int) → int
```

Read an analog input pin.

Parameters:
pin – the pin to be read
Returns:
the analog value of `pin`
Return type:
int

```
analog_output(pin: int, value: int) → None
```

Set `pin` to analog level `value`. This is useful if `pin` is connected to a low-pass filter.

Parameters:

- **pin** – the pin to be used
- **value** – the analog output level (0 .. 255)

```
close() → None
```

Close the serial connection.

```
digital_input(pin: int) → int
```

Read a digital input pin.

Parameters:
pin – the pin to be read
Returns:
the pin state of `pin`
Return type:
int

```
digital_input_pullup(pin: int) → int
```

Read a digital input pin with internal pullup enabled.

Parameters:
pin – the pin to be read
Returns:
the pin state of `pin`
Return type:
int

```
digital_output(pin: int, state: int) → None
```

Write a digital output pin.

Parameters:

- **pin** – the pin to be written
- **state** – the state for `pin`

```
get_board_name() → str
```

Return the board name read from the device.

```
get_version() → int
```

Return the version read from the device.

```
pwm(pin: int, value: int) → None
```

Set `pin` to pwm-level `value`.

Parameters:

- **pin** – the pin to be used
- **value** – the pwm level (0 .. 255)

Arduino Leonardo

`htf.arduino.ArduinoLeonardo` supports 14 digital input pins with and without internal pullup (D0 .. D13), 14 digital output pins (D0 .. D13), 12 analog input pins (A0 .. A5, A6 .. A11 on digital pins D4, D6, D8, D9, D10, and D12) and 6 analog output (pwm) pins (D3, D5, D6, D9, D10, D11 and D13).

To setup the Arduino Leonardo use:

```
from htf.arduino import ArduinoLeonardo
a = ArduinoLeonardo("/dev/ttyACM0")
# set pin D1 to 1
a.do3 = 1
# set pin D1 to 0
a.do3 = 0
# read pin D4
a.di4
>>> 0
# read pin D4 with internal pullup
a.dip4
>>> 1
# read A3
a.ai3
>>> 486
# set pwm level to 50 % on D3
a.pwm3 = 0x7f
# set analog voltage to 5 V on D5
a.ao5 = 0xff
```

```
class htf.arduino.ArduinoLeonardo(port: str, timeout: int | float = 0.5)
```

Initialize an ArduinoLeonardo.

Parameters:

- **port** – the name of the serial connection
- **timeout=0.5** – the time-out in seconds

```
__del__() → None
```

Automatically close serial connection on deletion.

```
analog_input(pin: int) → int
```

Read an analog input pin.

Parameters:
pin – the pin to be read
Returns:
the analog value of `pin`
Return type:
int

```
analog_output(pin: int, value: int) → None
```

Set `pin` to analog level `value`. This is useful if `pin` is connected to a low-pass filter.

Parameters:

- **pin** – the pin to be used
- **value** – the analog output level (0 .. 255)

```
close() → None
```

Close the serial connection.

```
digital_input(pin: int) → int
```

Read a digital input pin.

Parameters:
pin – the pin to be read
Returns:
the pin state of `pin`
Return type:
int

```
digital_input_pullup(pin: int) → int
```

Read a digital input pin with internal pullup enabled.

Parameters:
pin – the pin to be read
Returns:
the pin state of `pin`
Return type:
int

```
digital_output(pin: int, state: int) → None
```

Write a digital output pin.

Parameters:

- **pin** – the pin to be written
- **state** – the state for `pin`

```
get_board_name() → str
```

Return the board name read from the device.

```
get_version() → int
```

Return the version read from the device.

```
pwm(pin: int, value: int) → None
```

Set `pin` to pwm-level `value`.

Parameters:

- **pin** – the pin to be used
- **value** – the pwm level (0 .. 255)

Arduino Leonardo Digital Input

`htf.arduino.ArduinoLeonardoDigitalInput` can be used to read all 14 digital inputs (pins 0 .. 13) and to count edges (using pin-change interrupts) on pins 0, 1, 2 and 3.

To use the Arduino Leonardo Digital Inputs:

```
di = ArduinoLeonardoDigitalInput("COM4")
print("Version:", di.get_version())
data = di.get()
print(data) # a dictionary containing all data
```

All entries in `data` starting with `"d"` are digital input states, ie. `0` or `1`. All entries in `data` starting with `"c"` are edge counts, ie. `unsigned long int`. Edge counts can be reset using `reset`.

```
class htf.arduino.ArduinoLeonardoDigitalInput(port: str, reset_on_init: bool = True,
timeout: int | float = 0.5)
```

`ArduinoLeonardoDigitalInput` reads inputs (on pins 0 .. 13) and counts edges (on pins 0, 1, 2 and 3) using pin change interrupts on Arduino Leonardo.

Serial connection: 115200 baud, 8N1.

Parameters:

- **port** – the com port the Arduino Leonardo listens to running the digital input application.
- **reset_on_init=True** – reset internal edge counters on initialization.
- **timeout=0.5** – the timeout for serial communication in seconds.

```
close() → None
```

Close serial connection.

```
get() → Dict[str, int]
```

Get current data, ie. digital input states and edge counts.

Returns:
the current data containing digital port states and counter values.

E.g. {'d0':1,'d1':1,'d2':0,'d3':1,'d4':1,'d5':1,'d6':1,'d7':1,'d8':1,'d9':1,'d10':1,'d11':1,'d12':1, 'd13':1,'c0':0,'c1':0,'c2':77,'c3':102}

Return type:
dict

```
get_version() → bytes
```

Get software version.

Returns:
the software version.
Return type:
bytes

```
reset() → None
```

Reset all edge counters.

DAQmx — National Instruments DAQmx C-api wrapper

htf has built-in support for National Instruments DAQmx.

Adapters

DAQmx is a python wrapper to the National Instruments DAQmx driver.

Adapters are abstract helper classes to simply use the National Instruments hardware.

You need the `io` feature in your license to unlock the DAQmx features.

Digital Input Single Line

Simple usage:

```
from htf.daqmx import DigitalInputSingleLine

di = DigitalInputSingleLine("cDaq1Mod1/line0")
print(di.get())
```

Usage in delegation context:

```
from htf.daqmx import DigitalInputSingleLine

class HardwareAbstraction(DelegatorMixin):
    def __init__(self):
        self.di = DigitalInputSingleLine("cDaq1Mod1/line0")

ha = HardwareAbstraction()
# get current value
print(ha.di)
```

```
class htf.daqmx.DigitalInputSingleLine(descriptor: str)
```

`DigitalInputSingleLine` is used to access a single digital input line on a DAQmx device.

A DAQmx task is automatically created and deleted in the constructor and destructor.

Parameters:
descriptor – The DAQmx device and line descriptor, eg. *cDaq1Mod1/line0*.

```
close() → None
```

Close the abstractor by clearing the task.

```
get() → bool
```

Return the current pin state.

```
set(state: bool = True) → None
```

The setter for a delegate.

Parameters:
value – the value to be set.

Note

This method is abstract.

Digital Input Port

Simple usage:

```
from htf.daqmx import DigitalInputPort

di = DigitalInputPort("cDaq1Mod1/port0")
print(di.get())
```

Usage in delegation context:

```
from htf.daqmx import DigitalInputPort

class HardwareAbstraction(DelegatorMixin):
   def __init__(self):
      self.di = DigitalInputPort("cDaq1Mod1/port0")

ha = HardwareAbstraction()
# get current value
print(ha.di)
```

```
class htf.daqmx.DigitalInputPort(descriptor: str)
```

`DigitalInputPort` is used to access a digital input port on a DAQmx device.

A DAQmx task is automatically created and deleted in the constructor and destructor.

Parameters:
descriptor (*str*) – The DAQmx device and line descriptor, eg. *cDaq1Mod1/port0*.

```
close() → None
```

Close the abstractor by clearing the task.

```
get() → int
```

Return the current port state.

Digital Output Single Line

Simple usage:

```
from htf.daqmx import DigitalOutputSingleLine

do = DigitalOutputSingleLine("cDaq1Mod1/line0")
print(do.set(1))
```

Usage in delegation context:

```
from htf.daqmx import DigitalOutputSingleLine

class HardwareAbstraction(DelegatorMixin):
    def __init__(self):
        self.do = DigitalOutputSingleLine("cDaq1Mod1/line0")

ha = HardwareAbstraction()
# set current value to 1
ha.do = 1
```

```
class htf.daqmx.DigitalOutputSingleLine(descriptor: str)
```

`DigitalOutputSingleLine` is used to access a single digital output line on a DAQmx device.

A DAQmx task is automatically created and deleted in the constructor and destructor.

Parameters:
descriptor – The DAQmx device and line descriptor, eg. *cDaq1Mod1/line0*.

```
close() → None
```

Close the abstractor by clearing the task.

```
get() → bool
```

Read the current pin state.

```
reset() → None
```

Reset the pin state.

```
set(state: bool = True) → None
```

Set the pin state to `state`.

Parameters:
state=True – new state for output pin.

Digital Output Port

Simple usage:

```
from htf.daqmx import DigitalOutputPort

do = DigitalOutputPort("cDaq1Mod1/port0")
do.set(0x12345678)
```

Usage in delegation context:

```
from htf.daqmx import DigitalOutputPort

class HardwareAbstraction(DelegatorMixin):
    def __init__(self):
        self.do = DigitalOutputPort("cDaq1Mod1/port0")

ha = HardwareAbstraction()
# set current value to 0x12345678
ha.do = 0x12345678
```

```
class htf.daqmx.DigitalOutputPort(descriptor: str)
```

`DigitalOutputPort` is used to access a digital output port on a DAQmx device.

A DAQmx task is automatically created and deleted in the constructor and destructor.

Parameters:
descriptor (*str*) – The DAQmx device and line descriptor, eg. *cDaq1Mod1/port0*.

```
close() → None
```

Close the abstractor by clearing the task.

```
get() → int
```

Return the current port state.

```
set(value: int) → None
```

Set the port to `value`.

Parameters:
value (*float*) – new value for output port

Analog Voltage Input Single Line

Simple usage:

```
from htf.daqmx import AnalogVoltageInputSingleLine

ai = AnalogVoltageInputSingleLine("cDaq1Mod1/line0")
print(ai.get())
```

Usage in delegation context:

```
from htf.daqmx import AnalogVoltageInputSingleLine

class HardwareAbstraction(DelegatorMixin):
    def __init__(self):
        self.ai = AnalogVoltageInputSingleLine("cDaq1Mod1/line0")

ha = HardwareAbstraction()
# get current value
print(ha.ai)
```

```
class htf.daqmx.AnalogVoltageInputSingleLine(descriptor: str, minimum_voltage: float =
-10.0, maximum_voltage: float = 10.0, terminal_config: int = -1)
```

`AnalogVoltageInputSingleLine` is used to access a single analog output line on a DAQmx device.

A DAQmx task is automatically created and deleted in the constructor and destructor.

Parameters:

- **descriptor** – The DAQmx device and line descriptor, eg. *cDaq1Mod1/line0*
- **minimum_voltage=-10.0** – the minimum voltage.
- **maximum_voltage=10.0** – the maximum voltage.

- **terminal_config=DAQmx_Val_Cfg_Default** – the terminal configuration for DAQmxCreateAIVoltageChan(). Possible values: DAQmx_Val_RSE, DAQmx_Val_NRSE, DAQmx_Val_Diff, DAQmx_Val_PseudoDiff.

```
close() → None
```

Close the abstractor by clearing the task.

```
get() → float
```

Return the current pin value.

```
set(state: bool = True) → None
```

The setter for a delegate.

Parameters:
value – the value to be set.

> **Note**
> This method is abstract.

Analog Voltage Input Single Line Accurate (averaging analog input)

Simple usage:

```
from htf.daqmx import AnalogVoltageInputSingleLineAccurate

ai = AnalogVoltageInputSingleLineAccurate("cDaq1Mod3/ai0", numberOfSamples=100, timeout=3.0,
sampleFrequency=100)
print(ai.get())
```

Usage in delegation context:

```
from htf.daqmx import AnalogVoltageInputSingleLineAccurate

class HardwareAbstraction(DelegatorMixin):
    def __init__(self):
        self.ai = AnalogVoltageInputSingleLineAccurate("cDaq1Mod3/ai0", numberOfSamples=100,
timeout=3.0, sampleFrequency=100)

ha = HardwareAbstraction()
# get current value
print(ha.ai)
```

```
class htf.daqmx.AnalogVoltageInputSingleLineAccurate(descriptor: str, minimum_voltage:
float = -10.0, maximum_voltage: float = 10.0, number_of_samples: int = 2, sample_frequency:
float = 1000.0, timeout: float = 1.0, terminal_config: int = -1)
```

`AnalogVoltageInputSingleLineAccurate` is used to access a single analog input line on a DAQmx device. It acquires some samples and builds the average value of them.

A DAQmx task is automatically created and deleted in the constructor and destructor.

Parameters:

- **descriptor** – The DAQmx device and line descriptor, eg. *cDaq1Mod1/line0*
- **minimum_voltage=-10.0** – the minimum voltage.
- **maximum_voltage=10.0** – the maximum voltage.
- **number_of_samples=2** – the number of samples to acquire for one average value.
- **sample_frequency=1000.0** – the sample frequency in Hertz.
- **timeout=1.0** – the timeout when acquiring a new value in seconds.
- **terminal_config=DAQmx_Val_Cfg_Default** – the terminal configuration for DAQmxCreateAIVoltageChan(). Possible values: DAQmx_Val_RSE, DAQmx_Val_NRSE, DAQmx_Val_Diff, DAQmx_Val_PseudoDiff.

```
close() → None
```

Close the abstractor by clearing the task.

```
get() → float
```

Return the current pin value.

```
set(value: bool = True) → None
```

The setter for a delegate.

Parameters:
value – the value to be set.

Note

This method is abstract.

Analog Voltage Input Port

Simple usage:

```
from htf.daqmx import AnalogVoltageInputPort
```

```
aport = AnalogVoltageInputPort("cDaq1Mod3/ai0:2", numberOfLines=3, numberOfSamples=2, timeout=3.0,
sampleFrequency=1000)
print(aport.get())
# [
#     [line0_sample0, line0_sample1],
#     [line1_sample0, line1_sample1],
#     [line2_sample0, line2_sample1]
# ]
```

Usage in delegation context:

```
from htf.daqmx import AnalogVoltageInputPort

class HardwareAbstraction(DelegatorMixin):
    def __init__(self):
        self.aport = AnalogVoltageInputPort("cDaq1Mod3/ai0:2", numberOfLines=3, numberOfSamples=2,
timeout=3.0, sampleFrequency=1000)

ha = HardwareAbstraction()
# get current values
print(ha.aport)
# [
#     [line0_sample0, line0_sample1],
#     [line1_sample0, line1_sample1],
#     [line2_sample0, line2_sample1]
# ]
```

```
class htf.daqmx.AnalogVoltageInputPort(descriptor: str, minimum_voltage: float = -10.0,
maximum_voltage: float = 10.0, number_of_lines: int = 32, number_of_samples: int = 2,
sample_frequency: float = 1000.0, timeout: float = 1.0, terminal_config: int = -1,
continuous_mode: bool = False)
```

`AnalogVoltageInputPort` is used to access a single analog input port on a DAQmx device.

A DAQmx task is automatically created and deleted in the constructor and destructor.

Parameters:

- **descriptor** – The DAQmx device and line descriptor, eg. `cDaq1Mod1/line0`.
- **minimum_voltage=-10.0** – the minimum voltage.
- **maximum_voltage=10.0** – the maximum voltage.
- **number_of_lines=32** – the number of lines defined in the descriptor. For example the descriptor "cDaq1Mod3/ai0:31" defines 32 lines.
- **number_of_samples=2** – the number of samples to acquire for one average value.
- **sample_frequency=1000.0** – the sample frequency in Hertz.
- **timeout=1.0** – the timeout when acquiring a new value in seconds.
- **terminal_config=DAQmx_Val_Cfg_Default** – the terminal configuration for DAQmxCreateAIVoltageChan(). Possible values: DAQmx_Val_RSE, DAQmx_Val_NRSE, DAQmx_Val_Diff, DAQmx_Val_PseudoDiff.

- **continuous_mode=False** – if set to `True` continuous sampling is done and get() becomes blocking. Simply read samples in a loop.

```
close() → None
```

Close the abstractor by clearing the task.

```
get() → List[List[float]]
```

Return the current analog value.

Returned data layout:

```
[
    [line0 sample0, line0 sample1, ..., line0 sampleN-1],
    [line1 sample0, line1 sample1, ..., line1 sampleN-1],
    ...
    [lineM-1 sample0, lineM-1 sample1, ..., lineM-1 sampleN-1]
]
```

```
set(state: bool = True) → None
```

The setter for a delegate.

Parameters:
value – the value to be set.

Note

This method is abstract.

Analog Voltage Output Single Line

Simple usage:

```
from htf.daqmx import AnalogVoltageOutputSingleLine

ao = AnalogVoltageOutputSingleLine("cDaq1Mod1/line0")
print(ao.set(3.0))
```

Usage in delegation context:

```
from htf.daqmx import AnalogVoltageOutputSingleLine

class HardwareAbstraction(DelegatorMixin):
```

```
    def __init__(self):
        self.ao = AnalogVoltageOutputSingleLine("cDaq1Mod1/line0")

ha = HardwareAbstraction()
# set value
ha.ao = 1.337
```

```
class htf.daqmx.AnalogVoltageOutputSingleLine(descriptor: str, minimum_voltage: float =
-10.0, maximum_voltage: float = 10.0)
```

`AnalogVoltageOutputSingleLine` is used to access a single analog output line on a DAQmx device.

A DAQmx task is automatically created and deleted in the constructor and destructor.

Parameters:

- **descriptor** – The DAQmx device and line descriptor, eg. *cDaq1Mod1/line0*
- **minimum_voltage=-10.0** – the minimum voltage.
- **maximum_voltage=10.0** – the maximum voltage.

```
close() → None
```

Close the abstractor by clearing the task.

```
get() → float
```

Return the last written analog value.

```
set(value: float) → None
```

Set the pin value to `value`.

Parameters:
value – new state for output pin.

Analog Voltage Output Port

Simple usage:

```
from htf.daqmx import AnalogVoltageOutputPort

aport = AnalogVoltageOutputPort("cDaq1Mod3/ao0:2", numberOfLines=3, numberOfSamples=2, timeout=3.0,
sampleFrequency=1000)
# write data
data = [
        [line0_sample0, line0_sample1],
        [line1_sample0, line1_sample1],
```

```
        [line2_sample0, line2_sample1]
]

aport.set(data)
```

Usage in delegation context:

```
from htf.daqmx import AnalogVoltageOutputPort

class HardwareAbstraction(DelegatorMixin):
    def __init__(self):
        self.aport = AnalogVoltageOutputPort("cDaq1Mod3/ao0:2", numberOfLines=3, numberOfSamples=2,
timeout=3.0, sampleFrequency=1000)

ha = HardwareAbstraction()
# write data
data = [
        [line0_sample0, line0_sample1],
        [line1_sample0, line1_sample1],
        [line2_sample0, line2_sample1]
]
ha.aport = data
```

```
class htf.daqmx.AnalogVoltageOutputPort(descriptor: str, minimum_voltage: float = -10.0,
maximum_voltage: float = 10.0, number_of_lines: int = 32, number_of_samples: int = 2,
sample_frequency: float = 1000.0, timeout: float = 1.0, continuous_mode: bool = False)
```

`AnalogVoltageOutputPort` is used to access a single analog output port on a DAQmx device.

A DAQmx task is automatically created and deleted in the constructor and destructor.

Parameters:

- **descriptor** – The DAQmx device and line descriptor, eg. *cDaq1Mod1/line0*
- **minimum_voltage=-10.0** – the minimum voltage.
- **maximum_voltage=10.0** – the maximum voltage.
- **number_of_lines=32** – the number of lines defined in the descriptor. For example the descriptor "cDaq1Mod3/ai0:31" defines 32 lines.
- **number_of_samples=2** – the number of samples to write for every line.
- **sample_frequency=1000.0** – the sample frequency in Hertz.
- **timeout=1.0** – the timeout when acquiring a new value in seconds.
- **continuous_mode=False** – if set to `True` continuous sampling is done and get() becomes blocking. Simply read samples in a loop.

```
close() → None
```

Close the abstractor by clearing the task.

```
get() → List[List[float]]
```

Return the last written analog values.

Returned data layout:

```
[
    [line0 sample0, line0 sample1, ..., line0 sampleN-1],
    [line1 sample0, line1 sample1, ..., line1 sampleN-1],
    ...
    [lineM-1 sample0, lineM-1 sample1, ..., lineM-1 sampleN-1]
]
```

```
set(values: List[List[float]]) → None
```

Write analog data.

Parameters:
values – samples to be written on the output port.

`values` are expected to have the following layout:

```
[
    [line0 sample0, line0 sample1, ..., line0 sampleN-1],
    [line1 sample0, line1 sample1, ..., line1 sampleN-1],
    ...
    [lineM-1 sample0, lineM-1 sample1, ..., lineM-1 sampleN-1]
]
```

Edge Counter Input

Simple usage:

```python
from htf.daqmx import EdgeCounterInput

ctr0 = EdgeCounterInput(descriptor="cDaq1Mod4/ctr0", initialCount=0, risingEdge=True, countUp=True)
# get current value
print(ctr0.get())
# reset counter
ctr0.set(0)
# or
ctr0.reset()
# set counter to 10
ctr0.set(10)
```

Usage in delegation context:

```
from htf.daqmx import EdgeCounterInput

class HardwareAbstraction(DelegatorMixin):
    def __init__(self):
        self.edges = EdgeCounterInput(descriptor="cDaq1Mod4/ctr0", initialCount=0, risingEdge=True,
countUp=True)

ha = HardwareAbstraction()
# get current value
print(ha.edges)
# reset counter
ha.edges = 0
# set counter to 10
ha.edges = 10
```

```
class htf.daqmx.EdgeCounterInput(descriptor: str, initial_count: int = 0, rising_edge: bool
= True, count_up: bool = True)
```

`EdgeCounterInput` is used to access a counter input on a DAQmx device. The counter is 32 bit wide.

A DAQmx task is automatically created and deleted in the constructor and destructor.

Parameters:

- **descriptor** (*str*) – The DAQmx device and line descriptor, eg. *cDaq1Mod1/ctr0*.
- **initial_count=0** (*int*) – The initial count.
- **rising_edge=True** (*bool*) – If set to True rising edges are counted else falling edges are counted.
- **count_up=True** (*bool*) – If set to True the counter direction is up else it is down.

```
close() → None
```

Close the abstractor by clearing the task.

```
get() → int
```

Return the current edge count.

```
reset() → None
```

Reset the counter to 0.

```
set(count: int) → None
```

Set the count to the desired value.

Parameters:
count (*int*) – the new counter value

Frequency Input

Simple usage:

```
from htf.daqmx import FrequencyInput

f0 = FrequencyInput(descriptor="cDaq1Mod4/ctr0", fMin=1000.0, fMax=10000.0, measurementTime=0.001,
risingEdge=True)
print(f0.get())
```

Usage in delegation context:

```
from htf.daqmx import FrequencyInput

class HardwareAbstraction(DelegatorMixin):
    def __init__(self):
        self.f0 = FrequencyInput(descriptor="cDaq1Mod4/ctr0", fMin=1000.0, fMax=10000.0,
measurementTime=0.001, risingEdge=True)

ha = HardwareAbstraction()
# get current value
print(ha.f0)
```

```
class htf.daqmx.FrequencyInput(descriptor: str, f_min: float, f_max: float,
measurement_time: float, rising_edge: bool = True)
```

`FrequencyInput` is used to measure a low frequency in hertz on a DAQmx device.

A DAQmx task is automatically created and deleted in the constructor and destructor.

Parameters:

- **descriptor** (*str*) – The DAQmx device and line descriptor, eg. *cDaq1Mod1/ctr0*
- **f_min** (*float*) – The minimum frequency in the input signal in Hertz.
- **f_min** – The maximum frequency in the input signal in Hertz.
- **rising_edge=True** (*bool*) – If set to True rising edges are counted else falling edges are counted.
- **measurement_time** (*float*) – The measurement time in seconds.

```
close() → None
```

Close the abstractor by clearing the task.

```
get() → float
```

Return the current frequency.

Frequency Input Inaccurate

Usage:

```
from htf.daqmx import FrequencyInputInaccurate

fi = FrequencyInputInaccurate(descriptor="cDaq1Mod4/ctr0")
# measure 10 seconds with a sample rate of 10 Hz.
frequencies = fi.sample(period=0.1, samples=100)
# output the frequency list
print("frequencies:", frequencies)
```

```
class htf.daqmx.FrequencyInputInaccurate(descriptor: str)
```

FrequencyInputInaccurate is used to measure a frequency using an *EdgeCounterInput*.

In comparison to `FrequencyInput` frequencies below 100 Hz can be measured, too.

Parameters:
descriptor – The DAQmx device and line descriptor, eg. *cDaq1Mod1/ctr0*.

```
sample(period: float = 1.0, samples: int = 1) → List[float]
```

For *samples* times measure the count of edges within one *period* and convert it to Hz.

Returns an array containing the measured frequencies.

Parameters:

- **period** – the time in seconds between two samples.
- **samples** – the amount of samples.

Returns:
the list of samples.
Return type:
list of float

Task

DAQmx is a python wrapper to the National Instruments DAQmx driver. You can use the *task* to access the driver in an object oriented way.

National Instruments does not allow to copy any documentation so you have to search C-api reference for the method name. The C-api method name always has a prefix *DAQmx*.

You need the `io` feature in your license to unlock the DAQmx features.

```
class htf.daqmx.Task(name: str)
```

`Task` automatically creates a DAQmx task.

Every method that is called does not need the prefix `DAQmx` and you must not supply the first argument if it is a taskhandle.

The task is automatically cleared when the destructor is called.

Core

DAQmx is a python wrapper to the National Instruments DAQmx driver. You can use *core* to access the driver in c-style.

National Instruments does not allow to copy any documentation so you have to search C-api reference for the method name.

You need the `io` feature in your license to unlock the DAQmx features.

Changelog

htf-daqmx-3.2.0

- ship `cp312-abi3` wheels that are compatible with Python 3.12 and newer versions

htf-daqmx-3.1.6

- implement Cyber Resilience Act Conformity (CRA)
- update dependencies

htf-daqmx-3.1.5

- add support for Python 3.13

htf-daqmx-3.1.4

- add requirements for validation purposes

htf-daqmx-3.1.3

- add build environment data for validation purposes

htf-daqmx-3.1.2

- `htf-daqmx` can now be used standalone

htf-daqmx-3.1.1

- add support for Python 3.12

htf-daqmx-3.1.0

- add type-hints
- use `hlm-3.1`

htf-daqmx-3.0.1

- add support for Python 3.11

htf-daqmx-3.0.0

- extract `htf-daqmx` from `htf`

Power Supplies

htf support some programmable power supplies.

Rohde + Schwarz HMP Series programmable power supplies

The Rhode + Schwarz HMP Series are programmable power supplies that are supported by the HILSTER Testing Framework.

The user does not need not call any methods. He can use the automatic delegation to easily set current and voltage by assigning values to the members of the same names.

The abstraction supports virtual controls that appear as class members. These are `voltage<i>`, `actual_voltage<i>`, `current<i>` and `actual_current<i>`. `<i>` it the port `(1..4)`.

For most usecases using the virtual controls should be appropriate.

To setup a HMP 2020 power supply use:

```
from htf.power supply import HMP2020

h = HMP2020("COM3")

# set the voltage on port 1
h.voltage1 = 1.23
# print the measured voltage on port 1
print(h.actual_voltage1)

# set the current on port 2
h.current2 = 0.2
# print the measured current on port 2
print(h.actual_current2)
```

To make use of R&S®HO720 or R&S®HO730 Dual Interface via ethernet you can simply pass a url e.g.

```
h = HMP4040("socket://hmp4040-ip-address:5025")  # change to your ip address or hostname
```

```
class htf.powersupply.rs_hmpseries.HMP2020(port: str, baudrate: int = 9600,
parity: str = 'N', stopbits: int | float = 1, timeout: int | float = 1.0, command_delay: int
| float = 0.05, wait_after_set_voltage: bool = False, wait_time: int | float = 0.5)
```

HMP2020: 1 × 0 V to 32 V/0 A to 10 A; 1 × 0 V to 32 V/0 A to 5 A (188 W)

```
class htf.powersupply.rs_hmpseries.HMP2030(port: str, baudrate: int = 9600,
parity: str = 'N', stopbits: int | float = 1, timeout: int | float = 1.0, command_delay: int
| float = 0.05, wait_after_set_voltage: bool = False, wait_time: int | float = 0.5)
```

HMP2030: 3 × 0 V to 32 V/0 A to 5 A (188 W)

```
class htf.powersupply.rs_hmpseries.HMP4030(port: str, baudrate: int = 9600,
parity: str = 'N', stopbits: int | float = 1, timeout: int | float = 1.0, command_delay: int
| float = 0.05, wait_after_set_voltage: bool = False, wait_time: int | float = 0.5)
```

HMP4030: 3 × 0 V to 32 V/0 A to 10 A (384 W)

```
class htf.powersupply.rs_hmpseries.HMP4040(port: str, baudrate: int = 9600,
parity: str = 'N', stopbits: int | float = 1, timeout: int | float = 1.0, command_delay: int
| float = 0.05, wait_after_set_voltage: bool = False, wait_time: int | float = 0.5)
```

HMP4040: 4 × 0 V to 32 V/0 A to 10 A (384 W)

Manson HCS-3XXX

The Manson HCS-3XXX is a programmable power supply unit family.

The user does not need not call any methods. He can use the automatic delegation to easily set current and voltage by assigning values to the members of the same names.

```
from htf.powersupply import MansonHCS3xxx

m - MansonHCS3xxx("COM3")

# set output to 4 V
m.voltage = 4
print(m.voltage)
# set current (maximum) to 0.5 A
m.current = 0.5
print(m.current)
```

To store presets for current and voltage levels use the `store_presets` method. You can store up to three presets.

```
presets = {
    'P1': {'current': 12.0, 'voltage': 5.0},
    'P2': {'current': 12.0, 'voltage': 13.8},
    'P3': {'current': 12.0, 'voltage': 25.0}}
m.store_presets(presets)
```

```
class htf.powersupply.manson_hcs_3xxx.MansonHCS3xxx(port: str, baudrate: int = 9600, parity:
str = 'N', stopbits: int | float = 1, timeout: int | float = 1.0, decimal_places_for_current:
int = 1, debug: bool = False)
```

`MansonHCS3xxx` is a hardware abstraction to the Manson HCS-3xxx power supply family using a UART to control it.

`MansonHCS3xxx` uses `DelegatorMixin` to automatically set and read it's members *voltage* and *current*.

Parameters:

- **port** – the comport to be used, eg. "COM3", 3 or "/dev/ttyUSB0", etc.
- **decimal_places_for_current=1** – the number of decimal places for the current. HCS-3100, 3150, 3200 and 3202 have one decimal place. HCS-3102, 3014 and 3204 have two decimal places.
- **debug=False** – if set to *True* debugging is enabled

```
close() → None
```

Close the serial member. This method is automatically called when `__del__` is called.

```
disable_output() → None
```

Disable output.

```
enable_output() → None
```

Enable output.

```
get_current() → float
```

Read the current current from device and return the result.

Returns:
the current current.
Return type:
float

```
get_display_voltage_current_and_status() → Dict[str, Any]
```

Get the display voltage, current and status.

Returns:
a dictionary containing “voltage”, “current” and “status”.
Return type:
dict

```
get_preset_maximum_current() → float
```

Get preset maximum current for current preset.

Returns:
the preset maximum current.
Return type:
float

```
get_preset_maximum_voltage() → float
```

Get preset maximum voltage for current preset.

Returns:
the preset maximum voltage.
Return type:
float

```
get_preset_maximum_voltage_and_current() → Dict[str, float]
```

Get the preset maximum voltage and current.

Returns:
a dictionary containing “voltage” and “current”.
Return type:
dict

```
get_preset_voltage_and_current() → Dict[str, float]
```

Get the preset voltage and current.

Returns:
a dictionary containing “voltage” and “current”.
Return type:
dict

```
get_presets() → Dict[str, Dict[str, float]]
```

Get three voltage-current presets.

Returns:
a dictionary containing “voltage”, “current” and “P<preset>”.
Return type:
dict

```
get_voltage() → float
```

Read current voltage from device and return the result.

Returns:
the current voltage.
Return type:
float

```
load_preset(preset: int) → None
```

Load preset `preset`.

Parameters:
preset – may be 0, 1, or 2.

```
preset_maximum_current(current: int | float) → None
```

Set maximum voltage for current preset.

```
preset_maximum_voltage(voltage: int | float) → None
```

Set maximum voltage for current preset.

```
query(query: bytes, answer_lines: int = 1) → List[bytes] | None
```

Send a command and wait for the answer.

Parameters:

- **query** – the query to be sent.
- **answer_lines=1** – the number of lines to be received.

Returns:
the answer line(s).
Return type:
str
Raises:
manson_hcs_3xxx.TimeoutException – if a communication time-out occurred.

```
set_current(current: int | float) → None
```

Set the output current to `current`.

Parameters:
current – the current in units of amperes as int(), float() or string, eg. 0, 0.5, “0.5” or even “0.5 mA” work.

```
set_voltage(voltage: int | float) → None
```

Set the output voltage to `voltage`.

Parameters:
voltage – the voltage in units of volts as int(), float() or string, eg. 23, 23.0, “23.0” or even “23.0 V” work. *voltage* may have on decimal point. If *voltage* is `None` the output is disabled.

```
store_presets(presets: Dict[str, Dict[str, float]]) → None
```

Store three voltage-current presets.

Parameters:
presets – a dictionary containing the key P1, P2 and P3. Each key contains “voltage” and “current” keys.

KORAD KA3005P

The KORAD KA3005P is a programmable power supply unit.

To use the implementation you do not need to call any methods. Simply use the automatic delegation to easily set current and voltages by assigning values to the members of the same name.

```
from htf.powersupply import KORAD_KA3005P

k = KORAD_KA3005P("COM3")

# set output to 4 V
k.voltage = 4
print(k.voltage)
# set current (maximum) to 0.5 A
k.current = 0.5
print(k.current)
```

```
class htf.powersupply.korad_ka3005p.KORAD_KA3005P(port: str, baudrate: int = 9600, parity:
str = 'N', stopbits: int | float = 1, timeout: int | float = 1.0, debug: bool = False)
```

`KORAD_KA3005P` is a hardware abstraction to the KORAD KA3005P power supply unit using a UART to control it.

`KORAD_KA3005P` uses `DelegatorMixin` to automatically set and read it's members `voltage` and `current`.

Parameters:

- **port** – the comport to be used, eg. "COM3", 3 or "/dev/ttyUSB0", etc.
- **debug=False** – if set to `True` debugging is enabled.

```
close() → None
```

Close the serial member. This method is automatically called when `__del__` is called.

```
disable_output() → None
```

Disable output.

```
enable_output() → None
```

Enable output.

Raises:
SetOutputException – if output was not set.

```
get_current_current(channel: int = 1) → float
```

Read the current current from device and return the result.

Parameters:
channel – the channel to use. Shall always be 1.
Returns:
the current current.
Return type:
float

```
get_current_voltage(channel: int = 1) → float
```

Read current voltage from device and return the result.

Parameters:
channel=1 – the channel to use. Shall always be 1.
Returns:
the current voltage.
Return type:
float

```
get_id() → bytes | None
```

Return the KORAD id.

Returns:
the KORAD id.
Return type:
str

```
get_status() → Dict[str, str]
```

Read device status and return a dictionary.

Returns:
the status dictionary containing the keys “ch1 mode”, “ch2 mode”, “tracking mode”, “beep”,
”lock” and “output”.

Return type:
dict

```
query(query: bytes, length_of_answer: int | None = None, retries: int = 3) → bytes
```

Send a command and wait for the answer.

Parameters:

- **query** – the query to be sent.
- **length_of_answer=None** – the maximum number of bytes to be received.

- **retries=3** – the number of retries.

Returns:
the answer.
Return type:
bytes
Raises:
korad_ka3005p.TimeoutException – if a communication time-out occurred.

```
send_command(command: bytes) → None
```

Directly send a command to the power supply unit.

Parameters:
command – the command to be sent.

```
set_current(current: int | float, channel: int = 1) → None
```

Set the output current for a given channel.

Parameters:

- **current** – the current in units of amperes as int(), float() or string, eg. 0, 0.5, “0.5” or even “0.5 mA” work.
- **channel** – the channel to use. Shall always be 1.

Raises:
SetCurrentException – if current was not set.

```
set_voltage(voltage: int | float, channel: int = 1) → None
```

Set the output voltage for a given channel.

If `voltage` is None the output is disabled. If `voltage` is not None the output is enabled. If `voltage` changes the output is first disabled, changed, and then enabled again.

Parameters:

- **voltage** – the voltage in units of volts as int(), float() or string, eg. 23, 23.0, “23.0”
- **work.** (*or even "23.0 V"*)
- **channel** – the channel to use. Shall always be 1.

Raises:
SetVoltageException – if voltage was not set.

Changelog

htf-powersupply-4.1.0

- ship `cp312-abi3` wheels that are compatible with Python 3.12 and newer versions

htf-powersupply-4.0.6

- implement Cyber Resilience Act Conformity (CRA)
- update dependencies

htf-powersupply-4.0.5

- add support for Python 3.13

htf-powersupply-4.0.4

- add requirements for validation purposes

htf-powersupply-4.0.3

- add build environment data for validation purposes

htf-powersupply-4.0.2

- `htf-powersupply` can now be used standalone

htf-powersupply-4.0.1

- add support for Python 3.12

htf-powersupply-4.0.0

- remove all camel-case methods
- add type-hints
- use `hlm-3.1`
- rename `comport` to `port` for all HMP power supplies

htf-powersupply-3.0.1

- add support for Python 3.11

htf-powersupply-3.0.0

- extract `htf-powersupply` from `htf`

Retry Functions

The retry functions can be used to do automatic retries. There are three different ways to use them. `htf.retry` can be called directly. `htf.retriable` is a decorator that can be used to decorate functions so that they are retried and `htf.retrying` is a context manager that can be used to do retries within a context block.

If an exception occurs during execution of the action, it is retried until the maximum number of attempts is reached. Exceptions during the last retry are re-raised to inform the caller of its occurence.

The delay between attempts can also be specified. By default there is no delay.

Direct Calls

Direct calls are done using `htf.retry` or `htf.retry_sync`.

Using coroutines you can run:

```
import htf

count = 0

async def foo(bar):
    global count

    print("foo() called with", bar)
    print("count:", count)

    count += 1

    if count < 3:
        raise ValueError("count is too small")

    return "success"

await htf.retry(foo, args=("bar",), attempts=3, delay=1.0)
```

To avoid using coroutines, you can run:

```
import htf

count = 0

def foo(bar):
    global count

    print("foo() called with", bar)
    print("count:", count)

    count += 1

    if count < 3:
        raise ValueError("count is too small")

    return "success"

htf.retry_sync(foo, args=("bar",), attempts=3, delay=1.0)
```

```
async htf.retry(action: ~typing.Callable[[...], ~typing.Any], args: ~typing.Tuple | None =
None, kwargs: ~typing.Dict[str, ~typing.Any] | None = None, attempts: int = 2, delay: float |
None = None, retry_exceptions: ~typing.Tuple[~typing.Any] = (<class 'BaseException'>,)) → Any
```

Retry `action` with a given number of attempts and a given delay.

Parameters:

- **action** – the action to be retried (coroutines are supported)
- **args=()** – the positional arguments passed to `action`
- **kwargs={}** – the keyword arguments passed to `action`
- **attempts=2** – the number of attempts
- **delay=None** – the delay between attempts in seconds
- **retry_exceptions=** (*BaseException,*) – the exceptions to be catched to retry the action

Returns:
the return value of `action(*args, **kwargs)`

```
htf.retry_sync(action: ~typing.Callable[[...], ~typing.Any], args: ~typing.Tuple | None =
None, kwargs: ~typing.Dict[str, ~typing.Any] | None = None, attempts: int = 2, delay: float |
None = None, retry_exceptions: ~typing.Tuple[~typing.Any] = (<class 'BaseException'>,)) → Any
```

Retry `action` with a given number of attempts and a given delay.

Parameters:

- **action** – the action to be retried (coroutines are not supported)
- **args=()** – the positional arguments passed to `action`
- **kwargs={}** – the keyword arguments passed to `action`
- **attempts=2** – the number of attempts
- **delay=None** – the delay between attempts in seconds
- **retry_exceptions=** (*BaseException,*) – the exceptions to be catched to retry the action

Returns:
the return value of `action(*args, **kwargs)`

Using the Decorator

If a function or method is supposed to always do retries, the decorator `htf.retriable` can be used. If the decorated method is a coroutine the result is a coroutine, too.

```python
import htf

count = 0

@htf.retriable(attempts=3, delay=1.0)
def foo(bar):
    global count

    print("foo() called with", bar)
```

```
    print("count:", count)

    count += 1

    if count < 3:
        raise ValueError("count is too small")

    return "success"

foo("bar")
```

```
htf.retriable(attempts: int = 2, delay: float | None = None, retry_exceptions: Tuple[Any] =
(<class 'BaseException'>, )) → Callable[[Callable[[...], Any]], Any]
```

A decorator factory for retry(). Wrap your function in @retriable(...) to give it retry powers!

Parameters:

- **attempts=2** – the number of attempts
- **delay=None** – the delay between attempts in seconds
- **retry_exceptions=** (*BaseException,*) – the exceptions to be catched to retry the action

Returns:

a function decorator supporting retries. If a coroutine is supplied a coroutine is returned

else not.

Using the Context Manager

To use retries within a context block use the `htf.retrying` context manager.

```
import htf

count = 0

def foo(bar):
    global count

    print("foo() called with", bar)
    print("count:", count)

    count += 1

    if count < 3:
        raise ValueError("count is too small")

    return "success"

with htf.retrying(foo, attempts=3, delay=1.0) as retrying_foo:
    await retrying_foo("bar")
```

```
htf.retrying(action: ~typing.Callable[[...], ~typing.Any], attempts: int = 2, delay: float |
None = None, retry_exceptions: ~typing.Tuple[~typing.Any] = (<class 'BaseException'>,)) →
ContextManager | AsyncContextManager
```

A context manager for wrapping `action` with retry functionality with a given number of attempts and a given delay.

Parameters:

- **action** – the action to be retried
- **attempts=2** – the number of attempts
- **delay=None** – the delay between attempts in seconds
- **retry_exceptions=** (*BaseException,*) – the exceptions to be catched to retry the action

Returns:
a context manager supporting retries. If a coroutine is supplied an async context manager
is returned.

Issue Tracking

The HILSTER Testing Framework seamlessly integrates issue tracking systems.

JIRA (Atlassian)

The integration of JIRA issues can easily be realized using the `jira` fixture.

In JIRA the option `'Allow Remote API Calls'` must be enabled.

The `jira` fixture searches JIRA using the rest api to find issues for the current test. Found issues are appended to the test and put into the test report.

This way you do not need to put your issues into the source code of your tests.

By default issues must include `testcase.test` in the summary or the description, eg. `MyTestCase.test_foo`. This behaviour can be changed by changing the `query_template` accordingly.

To use the `jira` fixture you need to create your own fixture depending on it to provide the necessary JIRA URL and authentication credentials. The fixture should have the scope “session” and have the `auto` parameter set to `True`.

By default the `jira` fixture creates links that include the type, id and status of the referenced issue, e.g.
`Bug TRANS-1266 (Resolved): Dutch language does not reflect on keyboard shortcut dialog box`.

The default template for `link_template` is `"{fields/issuetype/name} {key} ({fields/status/name}): {fields/summary}"`. The `'/'` in the template describe the hierarchy in the api result. The api result is flattened and is used to format the template using the `string.format` method.

To be able to see all possible keys you should enable debugging to have a look at the flattend dictionary.

For `oauth` and `kerberos` authentication have a look at the python-jira documentation.

Example:

```
import htf

@htf.fixture('session', auto=True)
def setup_jira(jira):
    jira.setup_jira_connector(
        url="https://jira.atlassian.com",
        project="11460"
    )

def test_foo():
    pass
```

To enable debugging use the following code snippet.

```
import logging
logging.basicConfig()
logger = logging.getLogger("htf.jira")
logger.setLevel(level=logging.INFO)  # to enable info
logger.setLevel(level=logging.DEBUG)  # to enable info and debug
```

```
class htf.fixtures.jira(environment: TestEnvironment)
```

```
setup_jira_connector(url: str, project: str, username: str | None = None, password: str
| None = None, auth: str | None = None, oauth_dict: Dict[Any, Any] | None = None,
kerberos_options: Dict[Any, Any] | None = None, query_template: str | None = None,
title_template: str | None = None) → None
```

Set up the `jira` fixture so that it will search your JIRA installation for issues for the current test.

Parameters:

- **url** – the url to your JIRA installation
- **project** – the JIRA project
- **username=None** – the username to be used for authentication
- **password=None** – the password to be used for authentication
- **auth=None** –
  possible values are:
  - `None`: no authentication is used
  - `auth`: cookie based authentication

    - `basic_auth`: HTTP basic authentication
    - `oauth`: OAuth authentication is used (you have to supply `oauth_dict`, too)
    - `kerberos`: Kerberos authentication (you have to supply `kerberos_options`, too)
- **oauth_dict=None** – options for `oauth` authentication
- **kerberos_options=None** – options for `kerberos` authentication
- **query_template="default"** –
  the template for the JIRA query string. supported replacements are - `{testcase}`: is replaced with the TestCase's class name - `{test}`: is replaced with the current test name - `{project}`: is replaced with the supplied project
  default: "project={project} and (summary~"{testcase}.{test}" or description~"{testcase}.{test}")"
- **title_template="default"** – The template for the resulting title of the link in the test report. The issue is flattened using `'/'` as the separator. So the template may include keys like `{fields/status/name}` to show the name of the current ticket status, etc.

Thread — A traceable thread implementation

```
class htf.Thread(group: None = None, target: Callable[[...], Any] | None = None, name: str |
None = None, stop: Callable[[...], bool] | None = None, force_stop: bool = True, args:
Tuple[Any] | None = None, kwargs: Dict[str, Any] | None = None)
```

`Thread` extends `threading.Thread` to have a possibility to traceback where it was started.

This constructor should always be called with keyword arguments. Arguments are:

group should be None; reserved for future extension when a ThreadGroup class is implemented.

target is the callable object to be invoked by the run() method. Defaults to None, meaning nothing is called.

name is the thread name. By default, a unique name is constructed of the form "Thread-N" where N is a small decimal number.

args is the argument tuple for the target invocation. Defaults to ().

kwargs is a dictionary of keyword arguments for the target invocation. Defaults to {}.

If a subclass overrides the constructor, it must make sure to invoke the base class constructor (Thread.__init__()) before doing anything else to the thread.

```
is_alive() → bool
```

Return whether the thread is alive.

This method returns True just before the run() method starts until just after the run() method terminates. The module function enumerate() returns a list of all alive threads.

```
join(timeout: float | None = None) → None
```

Wait until the thread terminates.

This blocks the calling thread until the thread whose join() method is called terminates – either normally or through an unhandled exception or until the optional timeout occurs.

When the timeout argument is present and not None, it should be a floating point number specifying a timeout for the operation in seconds (or fractions thereof). As join() always returns None, you must call is_alive() after join() to decide whether a timeout happened – if the thread is still alive, the join() call timed out.

When the timeout argument is not present or None, the operation will block until the thread terminates.

A thread can be join()ed many times.

join() raises a RuntimeError if an attempt is made to join the current thread as that would cause a deadlock. It is also an error to join() a thread before it has been started and attempts to do so raises the same exception.

```
run() → None
```

Method representing the thread's activity.

You may override this method in a subclass. The standard run() method invokes the callable object passed to the object's constructor as the target argument, if any, with sequential and keyword arguments taken from the args and kwargs arguments, respectively.

```
start() → None
```

Start the thread's activity.

It must be called at most once per thread object. It arranges for the object's run() method to be invoked in a separate thread of control.

This method will raise a RuntimeError if called more than once on the same thread object.

Usage:

```
>>> def _thread():
...    print("test")

>>> thread = Thread(name="my-thread", target=_thread)
>>> thread.start()
>>> print(thread)
... <Thread(my-thread, started 1337,
...   File "/path/to/thread.py", line 23, in <module>
```

```
...     thread.start()
... )>
```

Metadata

Tests can have metadata, i.e. the source filename, revision, id, etc. .

```
class htf.MetaData(value: str | bytes)
```

`MetaData` can be used to mark variables to be handled as meta data.

For example `MetaData` can be used to set additional attributes of a test case that is put into the meta data section of a test report.

Initialize self. See help(type(self)) for accurate signature.

Example usage:

```
import htf

class ExampleTestCase(htf.TestCase):
    Id = htf.MetaData("$Id: example.py, author, deadbeef $")
    Revision = htf.MetaData("$Revision: deadbeef $")

    def test_1(self):
        pass

if __name__ == "__main__":
    htf.main()
```

Keywords

Commonly keywords are used in source code, eg. `$Id: ...$`.

There are several metadata aliases for these keywords. The resulting metadata the content but not the keywords that is actually expanded.

```
class htf.Id(value: str | bytes)
```

Returns “an id” in test report.

Initialize self. See help(type(self)) for accurate signature.

Example Usage:

```
Id("$Id$")
```

```
class htf.Revision(value: str | bytes)
```

Returns “a revision” in test report.

Initialize self. See help(type(self)) for accurate signature.

Example Usage:

```
class Test(TestCase):

    Revision = Revision("$Revision$")
```

```
class htf.Rev(value: str | bytes)
```

Returns “a revision” in test report.

Alias of `Revision`.

Initialize self. See help(type(self)) for accurate signature.

Example Usage:

```
class Test(TestCase):

    Rev = Rev("$Rev$")
```

```
class htf.LastChangedRevision(value: str | bytes)
```

Returns “a revision” in test report.

Alias of `Revision`.

Initialize self. See help(type(self)) for accurate signature.

Example Usage:

```
class Test(TestCase):

    LastChangedRevision = LastChangedRevision("$LastChangedRevision$")
```

```
class htf.Date(value: str | bytes)
```

Returns “a date” in test report.

Initialize self. See help(type(self)) for accurate signature.

Example Usage:

```
class Test(TestCase):

    Date = Date("$Date$")
```

```
class htf.LastChangedDate(value: str | bytes)
```

Returns “a date” in test report.

Alias of `Date`.

Initialize self. See help(type(self)) for accurate signature.

Example Usage:

```
class Test(TestCase):

    LastChangedDate = LastChangedDate("$LastChangedDate$")
```

```
class htf.Header(value: str | bytes)
```

Returns “a header” in test report.

Initialize self. See help(type(self)) for accurate signature.

Example Usage:

```
class Test(TestCase):

    Header = Header("$Header$")
```

```
class htf.Author(value: str | bytes)
```

Returns “an author” in test report.

Initialize self. See help(type(self)) for accurate signature.

Example Usage:

```
class Test(TestCase):

    Author = Author("$Author$")
```

```
class htf.LastChangedBy(value: str | bytes)
```

Returns the author of the last modification of the document.

Alias of `Author`.

Initialize self. See help(type(self)) for accurate signature.

Example Usage:

```
class Test(TestCase):

    LastChangedBy = LastChangedBy("$LastChangedBy$")
```

```
class htf.Source(value: str | bytes)
```

Returns: “a source file” in test report.

Initialize self. See help(type(self)) for accurate signature.

Example Usage:

```
class Test(TestCase):

    Source = Source("$Source$")
```

```
class htf.HeadURL(value: str | bytes)
```

Returns: “https://server:port:/file” in test report.

Initialize self. See help(type(self)) for accurate signature.

Example Usage:

```
class Test(TestCase):

    HeadURL = HeadURL("$HeadURL$")
```

```
class htf.URL(value: str | bytes)
```

Returns: “https://server:port:/file” in test report.

Alias of `HeadURL`.

Initialize self. See help(type(self)) for accurate signature.

Example Usage:

```
class Test(TestCase):

    URL = URL("$URL$")
```

```
class htf.RCSFile(value: str | bytes)
```

Returns: RCSFile marker

Initialize self. See help(type(self)) for accurate signature.

Example Usage:

```
class Test(TestCase):

    RCSFile = RCSFile("$RCSFile$")
```

```
class htf.RCSfile(value: str | bytes)
```

Returns: RCSfile marker

Alias of `RCSFile`.

Initialize self. See help(type(self)) for accurate signature.

Example Usage:

```
class Test(TestCase):

    RCSfile = RCSfile("$RCSfile$")
```

Miscellaneous

```
class htf.markers.TestingframeworkVersion
```

Returns: “htf-<htf-version> on Python <python-version>” in test report.

Initialize self. See help(type(self)) for accurate signature.

Example Usage:

```
class Test(TestCase):

    testingframeworkVersion = TestingframeworkVersion()
```

Filters — Building generic filter expressions

`filters` is a generic filter expression module to build arbitrary callable filters. A filter expression returns `True` or `False`.

NOT Filter

Functions as an invert of an individual filter.

```
filter_not(filter)
```

AND Filter

Returns `True` if all filter expressions return `True` individually.

```
filter_and(filter1, filter2, ..., filterN)
```

NAND Filter

Functions as an inverted AND Filter (`filter_and()`).

```
filter_nand(filter1, filter2, ..., filterN)
```

OR Filter

Returns `True` as soon as any of the filter expressions returns `True` individually.

```
filter_or(filter_or(filter1, filter2, ..., filterN))
```

NOR Filter

Functions as an inverted OR Filter (`filter_or()`).

```
filter_nor(filter1, filter2, ..., filterN)
```

XOR Filter

Returns `True` if an odd number of filters individually returns `True`. In this, Exceptions are rated as a filter returning `False`.

```
filter_xor(filter1, filter2, ..., filterN)
```

XNOR Filter

Functions as an inverted XOR Filter (`filter_xor()`).

```
filter_xnor(filter1, filter2, ..., filterN)
```

Examples

A possible example for an OR-Filter is:

```
from htf.filters import filter_or

def filter1(arg):
    return arg == 1

def filter2(arg):
    return arg == 2

filter1(1)  # True
filter1(2)  # False

filter1or2 = filter_or(filter1, filter2)  # create a new callable filter that matches 1 or 2

filter1or2(1)  # True
```

```
filter1or2(2)  # True
filter1or2(3)  # False
```

A possible example for a XOR-Filter is:

```
from htf.filters import filter_xor

t = lambda *args, **kwargs: True

print(filter_xor(t)())  # True
print(filter_xor(t, t)())  # False
print(filter_xor(t, t, t)())  # True
print(filter_xor(True, False)())  # True
```

Filters

```
htf.filters.filter_and(*filters: Callable[[...], bool]) → Callable[[...], bool]
```

Create a filter that combines all results or values of `*filters` using logical and.

Parameters:
***filters** – a tuple of filters.
Returns:
a filter that combines all elements in `*filters` using logical and.
Return type:
callable

```
htf.filters.filter_nand(*filters: Callable[[...], bool]) → Callable[[...], bool]
```

Create a filter that combines all results or values of `*filters` using logical nand.

Parameters:
***filters** – a tuple of filters.
Returns:
a filter that combines all elements in `*filters` using logical nand.
Return type:
callable

```
htf.filters.filter_nor(*filters: Callable[[...], bool]) → Callable[[...], bool]
```

Create a filter that combines all results or values of `*filters` using logical nor.

Parameters:
***filters** – a tuple of filters.
Returns:
a filter that combines all elements in `*filters` using logical nor.

Return type:
callable

```
htf.filters.filter_not(filter_method: Callable[[...], bool]) → Callable[[...], bool]
```

Create a filter that inverts `filter_method`'s result or values.

Parameters:
filter_method (*callable*) – the filter that is inverted.
Returns:
a filter that inverts `filter_method`.
Return type:
callable

```
htf.filters.filter_or(*filters: Callable[[...], bool]) → Callable[[...], bool]
```

Create a filter that combines all results or values of `*filters` using or-logic.

Parameters:
***filters** – a tuple of filters.
Returns:
a filter that conjuncts all elements in `*filters`.
Return type:
callable

```
htf.filters.filter_xnor(*filters: Callable[[...], bool]) → Callable[[...], bool]
```

Create a filter that combines all results or values of `*filters` using logical xnor.

Parameters:
***filters** – a tuple of filters.
Returns:
a filter that combines all elements in `*filters` using logical xnor.
Return type:
callable

```
htf.filters.filter_xor(*filters: Callable[[...], bool]) → Callable[[...], bool]
```

Create a filter that combines all results or values of `*filters` using xor-logic.

Parameters:
***filters** – a tuple of filters.
Returns:
a filter that xors all elements in `*filters`.
Return type:
callable

Changelog

htf-filters-4.1.0

- ship `cp312-abi3` wheels that are compatible with Python 3.12 and newer versions

htf-filters-4.0.6

- implement Cyber Resilience Act Conformity (CRA)
- update dependencies

htf-filters-4.0.5

- add support for Python 3.13

htf-filters-4.0.4

- add requirements for validation purposes

htf-filters-4.0.3

- add build environment data for validation purposes

htf-filters-4.0.2

- `htf-filters` can now be used standalone

htf-filters-4.0.1

- add support for Python 3.12

htf-filters-4.0.0

- remove all camel-case methods
- add type-hints
- use `hlm-3.1`

htf-filters-3.0.1

- add support for Python 3.11

htf-filters-3.0.0

- extract `htf-filters` from `htf`

Terminal Colors

HILSTER Testing Framework support terminal colors.

Terminal colors are automatically enabled if the terminal supports it.

They can be disabled by setting the environment variable `HTF_NO_COLORS` to any value.

Colored terminal output can be forced by setting the environment variable `HTF_FORCE_COLORS` to any value.

To print colored text use the methods supplied by `htf.termcolors`.

Example:

```
import htf.termcolors as tc

print(tc.yellow("WARNING: this text an error in yellow"))
print(tc.red("ERROR: this text an error in red"))
print(tc.white_on_cyan_bold("HILSTER"))
```

```
import htf.termcolors as tc

tc.demo()
```

```
htf.termcolors.blue(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: None. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: None. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: None. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_cyan(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_cyan'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_cyan_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_cyan'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_cyan_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_cyan'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_cyan_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_cyan'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_green(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_green'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_green_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_green'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_green_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_green'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_green_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_green'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_grey(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_grey'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_grey_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_grey'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_grey_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_grey'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_grey_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_grey'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_magenta(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_magenta'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_magenta_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_magenta'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_magenta_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘blue’. Background color: ‘on_magenta’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_magenta_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘blue’. Background color: ‘on_magenta’. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_red(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘blue’. Background color: ‘on_red’. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_red_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘blue’. Background color: ‘on_red’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_red_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_red'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_red_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_red'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_white(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_white'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_white_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_white'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_white_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_white'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_white_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_white'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_yellow(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_yellow'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_yellow_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_yellow'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_yellow_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_yellow'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_on_yellow_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: 'on_yellow'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.blue_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'blue'. Background color: None. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: None. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: None. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.critical(text: str) → str
```

Return colored text if supported by terminal using ANSI codes for a critical error.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: None. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: None. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: None. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_blue(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_blue'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_blue_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_blue'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_blue_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_blue'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_blue_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_blue'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_green(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_green'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_green_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_green'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_green_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_green'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_green_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_green'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_grey(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_grey'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_grey_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘cyan’. Background color: ‘on_grey’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_grey_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘cyan’. Background color: ‘on_grey’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_grey_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘cyan’. Background color: ‘on_grey’. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_magenta(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘cyan’. Background color: ‘on_magenta’. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_magenta_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_magenta'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_magenta_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_magenta'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_magenta_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_magenta'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_red(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_red'. Attributes: .

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_red_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_red'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_red_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_red'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_red_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_red'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_white(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_white'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_white_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_white'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_white_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_white'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_white_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_white'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_yellow(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_yellow'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_yellow_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_yellow'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_yellow_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_yellow'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_on_yellow_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: 'on_yellow'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.cyan_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'cyan'. Background color: None. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.debug(text: str) → str
```

Return colored text if supported by terminal using ANSI codes for a critical error.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.demo() → None
```

Print a color demo.

```
htf.termcolors.error(text: str) → str
```

Return colored text if supported by terminal using ANSI codes for an error.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.failure(text: str) → str
```

Return colored text if supported by terminal using ANSI codes for a failure.

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: None. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: None. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: None. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_blue(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: 'on_blue'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_blue_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: 'on_blue'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_blue_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: 'on_blue'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_blue_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: 'on_blue'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_cyan(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘green’. Background color: ‘on_cyan’. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_cyan_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘green’. Background color: ‘on_cyan’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_cyan_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘green’. Background color: ‘on_cyan’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_cyan_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘green’. Background color: ‘on_cyan’. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_grey(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘green’. Background color: ‘on_grey’. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_grey_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘green’. Background color: ‘on_grey’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_grey_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘green’. Background color: ‘on_grey’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_grey_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘green’. Background color: ‘on_grey’. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_magenta(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: 'on_magenta'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_magenta_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: 'on_magenta'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_magenta_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: 'on_magenta'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_magenta_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: 'on_magenta'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_red(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: 'on_red'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_red_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: 'on_red'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_red_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: 'on_red'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_red_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘green’. Background color: ‘on_red’. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_white(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘green’. Background color: ‘on_white’. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_white_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘green’. Background color: ‘on_white’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_white_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘green’. Background color: ‘on_white’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_white_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: 'on_white'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_yellow(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: 'on_yellow'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_yellow_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: 'on_yellow'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_yellow_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: 'on_yellow'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_on_yellow_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: 'on_yellow'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.green_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'green'. Background color: None. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: None. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: None. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: None. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_blue(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_blue'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_blue_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_blue'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_blue_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘grey’. Background color: ‘on_blue’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_blue_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘grey’. Background color: ‘on_blue’. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_cyan(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘grey’. Background color: ‘on_cyan’. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_cyan_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘grey’. Background color: ‘on_cyan’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_cyan_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_cyan'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_cyan_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_cyan'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_green(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_green'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_green_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_green'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_green_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_green'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_green_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_green'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_magenta(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_magenta'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_magenta_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_magenta'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_magenta_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_magenta'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_magenta_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_magenta'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_red(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_red'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_red_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘grey’. Background color: ‘on_red’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_red_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘grey’. Background color: ‘on_red’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_red_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘grey’. Background color: ‘on_red’. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_white(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘grey’. Background color: ‘on_white’. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_white_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_white'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_white_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_white'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_white_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_white'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_yellow(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_yellow'. Attributes: .

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_yellow_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_yellow'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_yellow_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_yellow'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_on_yellow_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: 'on_yellow'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.grey_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'grey'. Background color: None. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.info(text: str) → str
```

Return colored text if supported by terminal using ANSI codes for an information.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘magenta’. Background color: None. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘magenta’. Background color: None. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘magenta’. Background color: None. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_blue(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘magenta’. Background color: ‘on_blue’. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_blue_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘magenta’. Background color: ‘on_blue’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_blue_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘magenta’. Background color: ‘on_blue’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_blue_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_blue'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_cyan(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_cyan'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_cyan_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_cyan'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_cyan_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_cyan'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_cyan_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_cyan'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_green(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_green'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_green_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_green'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_green_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_green'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_green_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_green'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_grey(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_grey'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_grey_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_grey'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_grey_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘magenta’. Background color: ‘on_grey’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_grey_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘magenta’. Background color: ‘on_grey’. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_red(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘magenta’. Background color: ‘on_red’. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_red_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘magenta’. Background color: ‘on_red’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_red_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_red'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_red_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_red'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_white(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_white'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_white_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_white'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_white_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_white'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_white_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_white'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_yellow(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_yellow'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_yellow_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_yellow'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_yellow_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_yellow'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_on_yellow_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: 'on_yellow'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.magenta_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'magenta'. Background color: None. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.make_style(color: str | None = None, on_color: str | None = None, attrs:
List[str] | None = None) → Callable[[str], str]
```

Return a callable that has a parameter text that will be colored according to the parameters if coloring is supported.

Parameters:

- **color=None** – the color for the text
- **on_color=None** – the background color
- **attrs=None** – a list of attributes

```
htf.termcolors.on_blue(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_blue'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_blue_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_blue'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_blue_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_blue'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.

Return type:
str

```
htf.termcolors.on_blue_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_blue'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_cyan(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_cyan'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_cyan_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_cyan'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_cyan_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_cyan'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_cyan_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_cyan'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_green(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_green'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_green_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_green'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_green_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_green'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_green_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_green'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_grey(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_grey'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_grey_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_grey'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_grey_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: ‘on_grey’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_grey_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: ‘on_grey’. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_magenta(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: ‘on_magenta’. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_magenta_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: ‘on_magenta’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_magenta_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_magenta'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_magenta_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_magenta'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_red(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_red'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_red_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_red'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_red_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_red'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_red_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_red'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_white(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: 'on_white'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_white_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: ‘on_white’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_white_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: ‘on_white’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_white_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: ‘on_white’. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_yellow(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: ‘on_yellow’. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_yellow_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: ‘on_yellow’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_yellow_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: ‘on_yellow’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.on_yellow_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: ‘on_yellow’. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘red’. Background color: None. Attributes: .

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: None. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: None. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_blue(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: 'on_blue'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_blue_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: 'on_blue'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_blue_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: 'on_blue'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_blue_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: 'on_blue'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_cyan(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: 'on_cyan'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_cyan_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘red’. Background color: ‘on_cyan’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_cyan_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘red’. Background color: ‘on_cyan’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_cyan_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘red’. Background color: ‘on_cyan’. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_green(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘red’. Background color: ‘on_green’. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_green_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: 'on_green'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_green_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: 'on_green'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_green_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: 'on_green'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_grey(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: 'on_grey'. Attributes: .

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_grey_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: 'on_grey'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_grey_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: 'on_grey'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_grey_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: 'on_grey'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_magenta(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: 'on_magenta'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_magenta_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: 'on_magenta'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_magenta_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: 'on_magenta'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_magenta_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: 'on_magenta'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_white(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘red’. Background color: ‘on_white’. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_white_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘red’. Background color: ‘on_white’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_white_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘red’. Background color: ‘on_white’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_white_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘red’. Background color: ‘on_white’. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_yellow(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘red’. Background color: ‘on_yellow’. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_yellow_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘red’. Background color: ‘on_yellow’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_yellow_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘red’. Background color: ‘on_yellow’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_on_yellow_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘red’. Background color: ‘on_yellow’. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.red_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'red'. Background color: None. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.skipped(text: str) → str
```

Return colored text if supported by terminal using ANSI codes for something skipped.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.success(text: str) → str
```

Return colored text if supported by terminal using ANSI codes for a success.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.system(text: str) → str
```

Return colored text if supported by terminal using ANSI codes for system message.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:

str

```
htf.termcolors.underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: None. Background color: None. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.warning(text: str) → str
```

Return colored text if supported by terminal using ANSI codes for a failure.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘white’. Background color: None. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘white’. Background color: None. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: None. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_blue(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_blue'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_blue_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_blue'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_blue_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_blue'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_blue_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_blue'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_cyan(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_cyan'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_cyan_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_cyan'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_cyan_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘white’. Background color: ‘on_cyan’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_cyan_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘white’. Background color: ‘on_cyan’. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_green(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘white’. Background color: ‘on_green’. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_green_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘white’. Background color: ‘on_green’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_green_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_green'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_green_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_green'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_grey(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_grey'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_grey_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_grey'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_grey_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_grey'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_grey_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_grey'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_magenta(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_magenta'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_magenta_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_magenta'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_magenta_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_magenta'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_magenta_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_magenta'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_red(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_red'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_red_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘white’. Background color: ‘on_red’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_red_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘white’. Background color: ‘on_red’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_red_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘white’. Background color: ‘on_red’. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_yellow(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘white’. Background color: ‘on_yellow’. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_yellow_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_yellow'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_yellow_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_yellow'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_on_yellow_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: 'on_yellow'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.white_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'white'. Background color: None. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: None. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: None. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: None. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_blue(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_blue'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_blue_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_blue'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_blue_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_blue'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_blue_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_blue'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_cyan(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘yellow’. Background color: ‘on_cyan’. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_cyan_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘yellow’. Background color: ‘on_cyan’. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_cyan_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘yellow’. Background color: ‘on_cyan’. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_cyan_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: ‘yellow’. Background color: ‘on_cyan’. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_green(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_green'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_green_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_green'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_green_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_green'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_green_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_green'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_grey(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_grey'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_grey_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_grey'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_grey_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_grey'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_grey_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_grey'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_magenta(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_magenta'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_magenta_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_magenta'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_magenta_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_magenta'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_magenta_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_magenta'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_red(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_red'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_red_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_red'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_red_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_red'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_red_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_red'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_white(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_white'. Attributes: .

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_white_bold(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_white'. Attributes: bold.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_white_bold_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_white'. Attributes: bold, underline.

Parameters:
text – the text to be colored.
Returns:

`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_on_white_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: 'on_white'. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

```
htf.termcolors.yellow_underline(text)
```

Return colored text if supported by terminal using ANSI codes.

Foreground color: 'yellow'. Background color: None. Attributes: underline.

Parameters:
text – the text to be colored.
Returns:
`text` colored if supported by the terminal.
Return type:
str

Mixins

Mixins can be used to import code without inheritance.

Delegation

The *Delegation* mixins give the possibility to automatically delegate to members of a class without calling set() or get() directly.

Delegation is used for hardware abstractors.

```
class htf.mixins.DelegationError
```

`DelegationError` is thrown if `DelegateMixin` is used directly without being mixed in.

```
class htf.mixins.DelegateMixin
```

`DelegateMixin` defines `set` and `get` as methods that have to be overwritten by subclass.

```
get() → Any
```

The getter for a delegate.

Note

This method is abstract.

```
set(value: Any) → None
```

The setter for a delegate.

Parameters:
value – the value to be set.

Note

This method is abstract.

```
class htf.mixins.DelegateCallbackMixin(set_callback: Callable, get_callback: Callable)
```

`DelegateCallbackMixin` gives the possibility to user define setter and getter methods using a `DelegateMixin`.

Parameters:

- **set_callback** – the method to be called as a setter.
- **get_callback** – the method to be called as a getter.

```
class htf.mixins.DelegatorMixin
```

The `DelegatorMixin` automatically delegates calls for `DelegateMixin.set` and `DelegateMixin.get` to its members if they are instances of `DelegateMixin`.

Example usage:

```
class ConcreteDelegate(DelegateMixin):

    def __init__(self, parameter):
        self.parameter = parameter
        self.value = None
```

```
    def set(self, value):
        print(self.__class__.__name__ + ".set()", value)
        self.value = value

    def get(self):
        print(self.__class__.__name__ + ".get()")
        return self.value

class AnotherDelegate(ConcreteDelegate):
    pass

class A(DelegatorMixin):

    def __init__(self):
        self.member = ConcreteDelegate("parameter for member")
        self.test = AnotherDelegate("blub")

class NormalMember:

    def __init__(self, parameter):
        self.parameter = parameter
        self.value = None

    def set(self, value):
        print(self.__class__.__name__ + ".set()", value)
        self.value = value

    def get(self):
        print(self.__class__.__name__ + ".get()")
        return self.value

a = A()
print(a.member)
a.member = 1
print(a.member)
a.b = 2
print(a.b)
a.test = 1337
print(a.test)
a.blub = AnotherDelegate("rolf") # a new delegate is instantiated
a.blub = "peter" # now setting a value leads to a delegated call to AnotherDelegate().set("peter")
print(a.blub) # new reading is delegated to it
a.normalMember = NormalMember("normal")
a.normalMember = "test"
print(a.normalMember)
```

Checksums

Checksum consists of `htf.checksum.CRC`.

CRC

`htf.checksum.CRC` allows users to easily calculate crc checksums over data.

```
class htf.checksum.CRC(width: int, polynomial: int, reflect_input: bool, initial_value: int,
reflect_output: bool, xor_output: int)
```

A configurable CRC calculator.

The CRC constructor.

Parameters:

- **width** – the CRC's width in bits
- **polynomial** – the CRC's polynomial
- **reflect_input** – if set to `True` input is reflected
- **initial_value** – the initial value
- **reflect_output** – if set to `True` output is reflected
- **xor_output** – xor all outputs with `xor_output`

```
calculate(data: str | bytes | List[int]) → int
```

Calculates the crc over `data` bit by bit.

Parameters:
data – the input data to be used for the crc calculation
Returns:
the calculated crc for `data`
Return type:
int

Example

This example calculates a CRC-16 over `"123456789"`.

```
from htf.checksum import CRC

crc16 = CRC(width=16,
            polynomial=0x8005,
            reflect_input=True,
            initial_value=0,
            reflect_output=True,
            xor_output=0)

result = crc16.calculate(b"123456789")
assert result == 0xBB3D
```

Changelog

htf-checksum-3.2.0

- ship `cp312-abi3` wheels that are compatible with Python 3.12 and newer versions

htf-checksum-3.1.6

- implement Cyber Resilience Act Conformity (CRA)
- update dependencies

htf-checksum-3.1.5

- add support for Python 3.13

htf-checksum-3.1.4

- add requirements for validation purposes

htf-checksum-3.1.3

- add build environment data for validation purposes

htf-checksum-3.1.2

- `htf-checksum` can now be used standalone

htf-checksum-3.1.1

- add support for Python 3.12

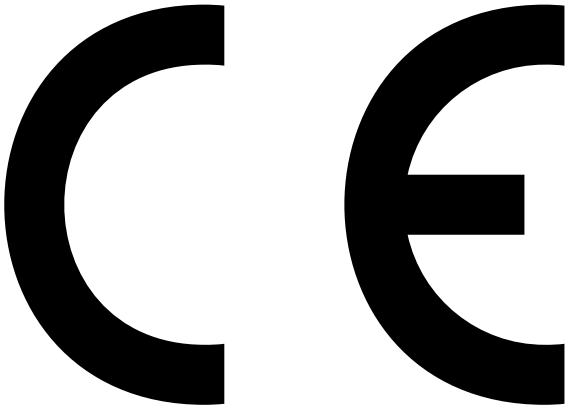
htf-checksum-3.1.0

- add type-hints
- use `hlm-3.1`

htf-checksum-3.0.1

- add support for Python 3.11

htf-checksum-3.0.0



- extract `htf-checksum` from `htf`

Cyber Resilience Act Conformity

This software is distributed by

HILSTER Testing Solutions GmbH
Amtsstraße 10
22143 Hamburg
Germany

Statement of Conformity

This software is placed on the market as a product with digital elements in the sense of Regulation (EU) 2024/2847 (Cyber Resilience Act, “CRA”). It is therefore subject to the conformity assessment obligations of the CRA.

This software is classified as “standard” risk class under the CRA.

Security Measures

As required by the CRA, HILSTER Testing Solutions GmbH takes the following measures to ensure a high level of security:

- Regular review of the source code and the dependencies used
- Prompt provision of updates for known security vulnerabilities
- Minimised collection and storage of user data
- No telemetry or automatic transmission of data to third parties

Reporting Vulnerabilities

Security vulnerabilities can be reported at any time by sending an e-mail to security@hilster.io.

> **Note**
> This statement is for information purposes only and does not constitute a declaration of conformity within the meaning of the Cyber Resilience Act.

Changelog

htf-4.3.1

- update dependencies

htf-4.3.0

- ship `cp312-abi3` wheels that are compatible with Python 3.12 and newer versions
- update installation instructions
- ISO/TR 80002-2 certification is being discontinued

> **Note**
>
> Compliance Update: Formal ISO/TR 80002-2 certification is suspended until further notice to prioritize the full implementation of the Cyber Resilience Act (CRA) regulations. Eliminating regulatory redundancies allows us to focus development resources on upcoming legal cybersecurity requirements.

htf-4.2.6

- implement Cyber Resilience Act Conformity (CRA)
- update dependencies

htf-4.2.5

- update dependencies
- use latest hlm
- fix a bug that showed `None`'s docstring as the tests's docstring
- clarify wording in End-User License Agreement (EULA) for htf-community

htf-4.2.4

- add support for Python 3.14

htf-4.2.3

- automatically enable colored terminal output in GitLab CI/CD
- add an option to force colored terminal output

htf-4.2.2

- add support for Xentara

htf-4.2.1

- add support for Python 3.13
- improve automatic update check

htf-4.2.0

- add support for Matrix Requirements ALM/QMS
- Behavior Driven Development now supports repeated keywords to implement complex tests with BDD
- add `htf.implements` and the `Implements:` keyword for Behavior Driven Development
- Replace some internal dependencies with Rust-based ones
- `htf` checks for available updates. See documentation for more information.
- add `htf.get_fixture` and `htf.get_fixture_sync` to access or instantiate fixtures outside tests
- `htf.fixtures.step` can be used as a `dict` now to report actual results of a step, for example
- fix an exception-related bug in generator fixtures leading to test reports with draft status
- improve rendering of metadata in HTML test report

htf-4.1.3

- htf-community now supports recent and supported Python versions with status `feature` or `bugfix`

htf-4.1.2

- fix a bug with steps and Behavior Driven Development tests in interactive tests

htf-4.1.1

- fix unlocking of explicit features

htf-4.1.0

- htf is certified for ISO/TR 80002-2: Medical device software - Part 2: Validation of software for medical device quality systems. See Certifications documentation for more information.

Note

ISO/TR 80002-2 applies to any software used in device design, testing, component acceptance, manufacturing, labelling, packaging, distribution and complaint handling or to automate any other aspect of a medical device quality system as described in ISO 13485.

ISO/TR 80002-2 applies to

- software used in the quality management system,
- software used in production and service provision, and
- software used for the monitoring and measurement of requirements.

It does not apply to

- software used as a component, part or accessory of a medical device, or
- software that is itself a medical device.

htf-4.0.4

- improve handling of module names for discovered files
- allow relative imports in test files
- fix a rare edge case during test discovery where tests were collected twice

htf-4.0.3

- use `docutils==0.20.1`

htf-4.0.2

- add support for Python 3.12

htf-4.0.1

- add support for LabJack DAQ devices in `htf-io==4.1.0`

htf-4.0.0

- add complete support for asyncio for tests, fixtures, steps, etc.
- add type hints
- remove all legacy code
- improve assertion formatting
- improve exception formatting
- add options to not open the browser automatically for Interactive Testing.
- add async `htf.fixtures.sleep` fixture

- `htf.retry` is a coroutine now and `htf.retry_sync` can be used instead to be backward compatible
- update all htf-module versions
- update dependencies

> **Warning**
>
> htf-4 is not fully backwards compatible to htf-3!
>
> - drop support for Python 3.7 and Python 3.8 (Raspberry Pi OS uses Python 3.9 now so this is not needed anymore)
> - PEP 8: all names are PEP-8-ified and camel-case aliases have been removed
> - some decorators now only return coroutines (but if they are only used as documented you will not have to change anything)
> - remote `logo` parameter from HTML test report
> - the parameter names for `htf.periodic` changed
> - `htf.TestCase` now expects set up and tear down methods in snake case: `set_up()`, `set_up_class`, `tear_down` and `tear_down_class` to be compatible to PEP 8
> - all camel case assertion methods were removed from `htf.TestCase` to be compatible to PEP 8
> - `failfast: bool` and `--failfast` have been renamed to `fail_fast: bool` and `--fail-fast`

htf-3.0.6

> **Warning**
>
> htf-3.0 reached the end of life. Please upgrade to htf-4.0 which can be used with little changes.

- update dependencies to fix installation problems

htf-3.0.5

- add support for Python 3.11
- add @metadata decorator

htf-3.0.4

- set test result before tearing down fixtures

htf-3.0.3

- fix exception handling with incorrectly formatted docstrings in HTML test report

- fix types in docstrings

htf-3.0.2

- improve exception handling in generator fixtures

htf-3.0.1

- add skip reasons to HTML Test Report Overview chart
- parameters is initialized with an empty `dict` instead of `None` if no parameters are supplied
- data driven testing generators are reset and thus can be run multiple times
- add start time, duration, etc. to draft reports
- open reports with absolute filenames to support Microsoft's browsers Edge and Internet Explorer when using `htf.main(..., open_reports=True)` or `htf --open-report`
- test result is `error` if `htf.SkipStep` is raised outside a test step

htf-3.0.0

> **Warning**
>
> htf-3 drops support for Python 2.7 and 32 bit software!
>
> This is why:
>
> - We offered Python 2.7 support for 2 years after Python 2.7's end of life on 2020-01-01.
> - No recent computer has a 32 bit processor anymore.
> - We will support the newest and commonly used versions of Python 3.x.

- `htf-3` adds support for Behavior Driven Development including tagging and requirements coverage
- add support for parameters to supply run-time parameters from command-line
- add support for overwriting settings from command-line to change settings at run-time
- update look and feel of QABench
- update and modernize HTML Test Report
- installation has changed and `pip install -i https://pypi.hilster.io htf` only installs the core of `htf` use `pip install -i https://pypi.hilster.io htf[full]` for the behavior of older versions and get more information in the installation instructions and installation options
- `htf` is split into multiple wheels (some imports changed)
- `htf -s` to minimize report size is now `htf -M`

- `htf-3` uses `oser-3` (needs a few changes - see oser's changelog)
- add a configurable timeout to power supplies
- add support for `pip-21`

htf-2.0.18

> **Warning**
> htf-2.0 reached the end of life on January 1st, 2022. Please upgrade to htf-3.0 which can be used with little changes.

- update look and feel of QABench
- update and modernize HTML Test Report
- make tags generated by data driven tests usable
- fix `htf.skip_if` when using callable conditions defined in classes

htf-2.0.17

- use `hlm-2.0.1`

htf-2.0.16

- Modbus TCP transaction identifier can overflow now
- add an exception if Modbus TCP receives an unexpected response
- convert all test run metadata's values to strings

htf-2.0.15

- fixtures are not instantiated if a test is skipped using `htf.skip` or `htf.skip_if`
- fix generation of test steps in `htf.DOORSTestReport`

htf-2.0.14

- force installation of `docutils==0.16`

htf-2.0.13

- fix tear down order of dependant fixtures
- add support for ethernet, general output as well as storing and recalling instrument states for the Rohde + Schwarz HMP Series programmable power supplies

htf-2.0.12

- fix HTML report loading for empty mimetypes in attachments and empty metadata

htf-2.0.11

- use `docutils==0.16`

htf-2.0.10

- fix evaluation crash when exceptions contained private use unicode characters
- fix error sometimes thrown in `htf.fixtures.delay` fixture

htf-2.0.9

- use `hlm-2.0`

htf-2.0.8

- fix usage of tags in combination with fixture tags
- fix fixture cleanup
- improve interaction user interface and fix a bug that caused it to freeze

htf-2.0.7

- reduce HTML report size
- improve stability and user experience of interaction user interface
- improve stability of test discovery
- fix disappearing steps in HTML report
- fix tags inheritance when using classes
- fix Modbus client's query method thread-safeness
- fix message in `htf.assertions.assert_list_equal`
- fix rarely occurring escaping error in JUnit XML report
- update to `pyserial==3.5`

htf-2.0.6

- use Dashboard report server url as is to support `Dashboard-1.0`
- add -o option to `report-tool` to open generated HTML reports
- fix date in HTML Test Report
- improve format of JUnit-XML-Testreport
- fix report merge errors with `report-tool`
- add support for Python 3.9
- update dependencies

htf-2.0.5

- fix docstring rendering in HTML Test Report's print view

htf-2.0.4

- fix threads fixture's `htf.fixtures.threads.stop` method
- `htf.fixtures.step` supports `*args` and `**kwargs`
- add `htf.fixtures.step.skip` to skip steps
- fix `htf.fixtures.jira` fixture
- fix printed list of collected fixtures
- fix some bugs on Python 2.7

htf-2.0.3

- fix shuffle

htf-2.0.2

- add @requirements decorator
- fix total test run time in output to correct display days
- update interfacing with the Dashboard

htf-2.0.1

- fix crash in Report Tool when converting from XML source

htf-2.0.0

- HTML Test Report is interactive now and is printable
- Completely renewed the internal test runner
- Interactive Testing
- Fixtures
- Report Tool
- Draft Reports in htf and htf.main()
- Stoppable Threads
- Tests can be shuffled in htf and htf.main()
- Test Steps can be hierarchic
- Reduce wheel size

> **Warning**
>
> htf-2 is not fully backwards compatible to htf-1!
>
> - PEP 8: all names are PEP-8-ified but have aliases for backwards compatibility. Some parameter names changed and you will have to change them yourself.
> - Verbosity: The `verbosity` parameter and `--verbosity` have been removed.
> - Catchbreak: The `catchbreak` parameter and `--catchbreak` have been removed. `catchbreak` is enabled by default.
> - TestCase: `_runThreadsEnable` was removed. Use the threads-fixture.

htf-1.3.14

> **Warning**
>
> htf-1.3 reached the end of life on August 15th, 2021. Please upgrade to htf-2.0 which can be used with little changes.

- use `docutils==0.16`

htf-1.3.13

- remove docs from wheels

htf-1.3.12

- use `hlm-2.0`
- fix Modbus client's query method thread-safeness

htf-1.3.11

- add support for Python 3.9
- fix tags inheritance when using classes
- fix Modbus client's query method thread-safeness
- fix rarely occurring escaping error in JUnit XML report
- update to `pyserial==3.5`

htf-1.3.10

- use Dashboard report server url as is to support `Dashboard-1.0`

htf-1.3.9

- fix HTTP status code for new Dashboard API

htf-1.3.8

- fix `htf` console entry point to enable networking in Linux

htf-1.3.7

- fix payload length calculation for HART command 3 and 61
- fix object clean up order in HartInterface and HartApplicationLayer
- fix potential element ordering problem in CSVFileIterator

htf-1.3.6

- build manylinux2014 wheels for Python 3.x and manylinux2010 wheels for Python 2.7

htf-1.3.5

- Serial Modbus clients and servers now accept additional serial parameters

htf-1.3.4

- `OserPrompt` now allows NaN for float values

htf-1.3.3

- fix `hlm` usage

htf-1.3.2

- > **Warning**
  >
  > Due to some bugfixes in hlm the host id might change. We're sorry. Please renew your license.

- add support for Python 3.8 (htf is shipped for Python 2.7, 3.6, 3.7 and 3.8 for Windows and Linux for 32 and 64 bit machines)
- update to `hlm-1.1`
- update to `oser~=1.3.3`
- fix HART `Time` encoding and decoding
- add HART response code `error_command_not_implemented`
- improve HART on Linux
- fix Modbus client debug
- add interactive mode for htf in Docker (see Interactive Mode)
- fix report server report and report upload

- improve docs for `skip_test` and `skip_step`

htf-1.3.1

- update to hlm-1.0.4
- update to oser-1.3.1

htf-1.3.0

- htf runs in Docker (see Docker Integration) on Linux and Windows
- add support for Data Driven Testing
- add a full-stack Modbus — The Modbus Testing Framework implementation
- add support for the Report Server (see htf.main() — Testscript utility and htf — Command line utility)
- completely revamped Settings and add support for settings with YAML and for default values
- add a YAML test report (see htf.main() — Testscript utility and htf — Command line utility)
- add an option to keep captured stdout and stderr only in case of a failed test (see htf.main() — Testscript utility and htf — Command line utility)
- improve console output for htf.main() — Testscript utility and htf — Command line utility
- nonexistent folders for test reports are created automatically
